OpenGL® ES
Common/Common-Lite Profile Specification

Version 1.1 (Annotated)

Editor (version 1.0): David Blythe
Editor (version 1.1): Aaftab Munshi

Contents

Chapter 1

Overview

This document outlines the OpenGL ES Common and Common-Lite profiles. A profile pipeline is described in the same order as in the OpenGL specification. The specification lists supported commands and state, and calls out commands and state that are part of the full (*desktop*) OpenGL specification but not part of the profile definition. This specification is *not* a standalone document describing the detailed behavior of the rendering pipeline subset and API. Instead, it provides a concise description of the differences between a full OpenGL renderer and the Common/Common-Lite renderer. This document is defined relative to the OpenGL 1.5 specification.

This document specifies the OpenGL Common/Common-Lite renderer. A companion document defines one or more bindings to window system/OS platform combinations analogous to the GLX, WGL, and AGL specifications. [1] If required, an additional companion document describes utility library functionality analogous to the GLU specification.

1.1 Conventions

This document describes commands in the identical order as the OpenGL 1.5 specification. Each section corresponds to a section in the full OpenGL specification and describes the disposition of each command relative to Common/Common-Lite profile definition. Where necessary, the profile specification provides additional clarification of the reduced command behavior.

Each section of the specification includes tables summarizing the commands and parameters that are retained in the Common and Common-Lite profiles. Several symbols are used within the tables to indicate various special cases. The symbol † indicates that the floating-point form of the command is replaced by its fixed-point variant from the `OES_fixed_point` extension. The symbol $\diamondsuit$ indicates that the double-precision form of the command is replaced with its single-precision variant from the `OES_single_precision` extension. The symbol $\ast$ indicates that an enumerant is part of a new ES-specific extension. The superscript ‡ indicates that the command is supported subject to additional constraints described in the section body containing the table.

> ■ Additional material summarizing some of the reasoning behind certain decisions is included as an annotation at the end of each section, set in this typeface. ❑

[1] See the OpenGL ES Native Platform Graphics Interface specification.

Chapter 2

OpenGL Operation

The basic GL operation remains largely unchanged. Two significant changes in the Common and Common-Lite profiles are that commands cannot be accumulated in a display list for later processing, and the first stage of the pipeline for approximating curve and surface geometry is eliminated. The remaining pipeline stages include: per-vertex operations and primitive assembly, pixel operations, rasterization, per-fragment operations, and whole framebuffer operations.

The Common/Common-Lite profile introduces several OpenGL extensions that are defined relative to the full OpenGL 1.5 specification and then appropriately reduced to match the subset of commands in the profile. These OpenGL extensions are divided into two categories: those that are fully integrated into the profile definition – *core additions*; and those that remain extensions – *profile extensions*. Core additions do not use extension suffixes, whereas profile extensions retain their extension suffixes. Chapter 7 summarizes each extension and how it relates to the profile definition. Complete extension specifications are included in Appendix B.

■ The OpenGL ES profiles are part of a wider family of OpenGL-derived application programming interfaces. As such, the profiles share a similar processing pipeline, command structure, and the same OpenGL name space. Where necessary, extensions are created to augment the existing OpenGL 1.5 functionality. OpenGL ES-specific extensions play a role in OpenGL ES profiles similar to that played by OpenGL ARB extensions relative to the OpenGL specification. OpenGL ES-specific extensions are either precursors of functionality destined for inclusion in future core profile revisions, or formalization of important but non-mainstream functionality.

Extension specifications are written relative to the full OpenGL specification so that they can also be added as extensions to an OpenGL 1.5 implementation and so that they are easily adapted to profile functionality enhancements that are drawn from the full OpenGL specification. Extensions that are part of the core profile do not have extension suffixes, since they are not extensions to the profile, though they are extensions to OpenGL 1.5. ❑

2.1 OpenGL Fundamentals

Commands and tokens continue to be prefixed by **gl** and **GL_** in all profiles. The wide range of support for differing data types (8-bit, 16-bit, 32-bit and 64-bit; integer and floating-point) is reduced wherever possible to eliminate non-essential command variants and to reduce the complexity of the processing pipeline. Double-precision floating-point parameters and data types are eliminated completely, while other command and data type variations are considered on a command-by-command basis and eliminated when appropriate. In the Common-Lite variation of the Common profile, the floating-point data type is also eliminated in favor of the fixed-point data type described in the `OES_fixed_point` extension specification.

2.1.1 Fixed-Point Computation

Both the Common and Common-Lite profile support fixed-point vertex attributes and command parameters using a 32-bit two's-complement signed representation with 16 bits to the right of the binary point (fraction bits). The Common profile pipeline retains the same range and precision requirements as specified in Section 2.1.1 of the OpenGL 1.5 specification. The Common-Lite profile pipeline must meet the range and precision requirements specified in the `OES_fixed_point` extension:

> Internal computations can use either fixed-point or floating-point arithmetic. Fixed-point computations must be accurate to within $\pm 2^{-15}$. The maximum representable magnitude for a fixed-point number used to represent positional or normal coordinates must be at least 2^{15}; the maximum representable magnitude for colors or texture coordinates must be at least 2^{10}. The maximum representable magnitude for all other fixed-point values must be at least 2^{15}. $x \cdot 0 = 0 \cdot x = 0$. $1 \cdot x = x \cdot 1 = x$. $x + 0 = 0 + x = x$. $0^0 = 1$. Fixed-point computations may lead to overflows or underflows. The results of such computations are undefined, but must not lead to GL interruption or termination.

Furthermore, the following additional constraint must be met for both profiles:

> Using the notation 16.16 to indicate a 32-bit two's-complement fixed-point number with 16 bits of fraction; if an incoming vertex is representable using 16.16, the modelview and projection matrices are representable in 16.16, and the resulting eye-space and NDC-space vertices are representable in 16.16 (when computed using intermediate representations with sufficient dynamic range), then the transformation pipeline must compute the eye-space and NDC-space vertices to some reasonable accuracy (i.e., overflow is not acceptable).

■ The Common-Lite profile is a fixed-point profile. The precision and dynamic range requirements are minimal to allow a broad range of implementations, while strong enough to allow portable application behavior for applications written strictly to the minimum behavior. The accuracy requirements allow pipeline implementations to internally use either fixed-point or floating-point arithmetic. The Common profile is a superset of the Common-Lite profile and requires floating-point-like dynamic range to avoid unexpected behavior in applications using floating-point input. ❑

2.2 GL State

The Common and Common-Lite profiles retain a large subset of the client and server state described in the full OpenGL specification. The separation of client and server state persists. Section 6.2 summarizes the disposition of all state variables relative to the Common/Common-Lite profile.

2.3 GL Command Syntax

The OpenGL command and type naming conventions are retained identically. The new types `fixed` and `clampx` are added with the corresponding command suffix, 'x'. Commands using the suffixes for the types: `byte`, `ubyte`, `short`, and `ushort` are not supported, except for glColor4ub. The type `double` and all double-precision commands are eliminated. The result is that the Common profile uses only the suffixes 'f', 'i', and 'x' and the Common-Lite profile uses only the suffixes 'i' and 'x'.

2.4 Basic GL Operation

The basic command operation remains identical to OpenGL 1.5. The major differences from the OpenGL 1.5 pipeline are that commands cannot be placed in a display list; there is no polynomial function evaluation stage; and blocks of fragments cannot be sent directly to the individual fragment operations.

2.5 GL Errors

The full OpenGL error detection behavior is retained, including ignoring offending commands and setting the current error state. In all commands, parameter values that are not supported by the profile are treated like any other unrecognized parameter value and an error results, i.e., `INVALID_ENUM` or `INVALID_VALUE`. Table 2.1 lists the errors.

OpenGL 1.5	Common	Common-Lite
`NO_ERROR`	✓	✓
`INVALID_ENUM`	✓	✓
`INVALID_VALUE`	✓	✓
`INVALID_OPERATION`	✓	✓
`STACK_OVERFLOW`	✓	✓
`STACK_UNDERFLOW`	✓	✓
`OUT_OF_MEMORY`	✓	✓
`TABLE_TOO_LARGE`	–	–

Table 2.1: Error Disposition

The command **GetError** is retained to return the current error state. As in OpenGL 1.5, it may be necessary to call **GetError** multiple times to retrieve error state from all parts of the pipeline.

OpenGL 1.5	Common	Common-Lite
GetError(`void`)	✓	✓

■ Well-defined error behavior allows portable applications to be written. Retrievable error state allows application developers to debug commands with invalid parameters during development. This is an important feature during initial profile deployment. ❑

2.6 Begin/End Paradigm

The Common and Common-Lite profiles draw geometric objects exclusively using vertex arrays. Associated colors, normals, and texture coordinates are specified using vertex arrays. The associated auxiliary values for color, normal, and texture coordinate can also be set using a small subset of the associated attribute specification commands described in Section 2.7. Since the commands **Begin** and **End** are not supported, no internal state indicating the begin/end state is maintained.

The `POINTS`, `LINES`, `LINE_STRIP`, `LINE_LOOP`, `TRIANGLES`, `TRIANGLE_STRIP`, and `TRIANGLE_FAN` primitives are supported. The `QUADS`, `QUAD_STRIP`, and `POLYGON` primitives are not supported.

Color index rendering is not supported. Edge flags are not supported.

OpenGL 1.5	**Common**	**Common-Lite**
Begin(`enum mode`)	–	–
End(`void`)	–	–
EdgeFlag[v](`T flag`)	–	–

■ The Begin/End paradigm, while convenient, leads to a large number of commands that need to be implemented. Correct implementation also involves suppression of commands that are not legal between Begin and End. Tracking this state creates an additional burden on the implementation. Vertex arrays, arguably can be implemented more efficiently since they present all of the primitive data in a single function call. Edge flags are not included, as they are only used when drawing polygons as outlines and support for **PolygonMode** has not been included.

Quads and polygons are eliminated since they can be readily emulated with triangles and it reduces an ambiguity with respect to decomposition of these primitives to triangles, since it is entirely left to the application. Elimination of quads and polygons removes special cases for line mode drawing requiring edge flags (should **PolygonMode** be re-instated). ❑

2.7 Vertex Specification

The Common profile does not include the concept of Begin and End. Vertices are specified using vertex arrays exclusively. Only `float`, `short`, and `byte` coordinate and component types are supported with the exception of `ubyte` rather than `short` color components. There is limited support for specifying the current color, normal, and texture coordinate using the fixed-point or floating-point forms of the commands **Color4**, **Normal3**, and **MultiTexCoord4**.

OpenGL 1.5	**Common**	**Common-Lite**
Vertex{**234**}{**sifd**}**[v]**(`T coords`)	–	–
Normal3f(`float coords`)	✓	†
Normal3{**bsifd**}**[v]**(`T coords`)	–	–
TexCoord{**1234**}{**sifd**}**[v]**(`T coords`)	–	–
MultiTexCoord4f(`enum texture, float coords`)	✓	†
MultiTexCoord123{**sifd**}**[v]**(`enum texture, T coords`)	–	–
MultiTexCoord4{**sid**}**[v]**(`enum texture, T coords`)	–	–
Color4f(`float components`)	✓	†
Color4ub[v](`T components`)	✓	✓
Color{**34**}{**bsifd ub us ui**}**[v]**(`T components`)	–	–
FogCoord{**fd**}**[v]**(`T coord`)	–	–
SecondaryColor3{**bsifd ub us ui**}**[v]**(`T components`)	–	–
Index{**sifd ub**}**[v]**(`T components`)	–	–

■ A handful of *fine grain* commands (**Color**, **Normal**, **MultiTexCoord**) are included so that per-primitive attributes can be set. For each command, the most general form of the floating-point version of the command is retained to simplify addition of extensions or future revisions. Since these commands are unlikely to be issued frequently, as they can only be used to set (overall) per-primitive attributes, performance is not an issue.

The Common and Common-Lite profiles support only the RGBA rendering model. One or more of the RGBA component depths may be zero. Color index rendering is not supported. ❑

2.8 Vertex Arrays

The `OES_byte_coordinates` extension allows vertex, normal and texture coordinates to be specified using `byte` types. Color index and edge flags are not supported. Both indexed and non-indexed arrays are supported, but the **InterleavedArrays** and **ArrayElement** commands are not supported.

OpenGL 1.5	Common	Common-Lite
VertexPointer(`int size, enum type, sizei stride, const void *ptr`)		
`size = 2,3,4 type = BYTE`	∗	∗
`size = 2,3,4 type = SHORT`	✓	✓
`size = 2,3,4 type = FLOAT`	✓	†
`size = * type = INT,DOUBLE`	–	–
NormalPointer(`enum type, sizei stride, const void *ptr`)		
`type = SHORT,BYTE`	✓	✓
`type = FLOAT`	✓	†
`type = INT,DOUBLE`	–	–
ColorPointer(`int size, enum type, sizei stride, const void *ptr`)		
`size = 4 type = UNSIGNED_BYTE`	✓	✓
`size = 4 type = FLOAT`	✓	†
`size = 3 type = FLOAT,UNSIGNED_BYTE`	–	–
`type = INT, DOUBLE`	–	–
TexCoordPointer(`int size, enum type, sizei stride, const void *ptr`)		
`size = 2,3,4 type = BYTE`	∗	∗
`size = 2,3,4 type = SHORT`	✓	✓
`size = 2,3,4 type = FLOAT`	✓	†
`size = 1 type = *`	–	–
SecondaryColorPointer(`int size, enum type, sizei stride, void *ptr`)	–	–
FogCoordPointer(`enum type, sizei stride, void *ptr`)	–	–
EdgeFlagPointer(`sizei stride, const void *ptr`)	–	–
IndexPointer(`enum type, sizei stride, const void *ptr`)	–	–
ArrayElement(`int i`)	–	–
DrawArrays(`enum mode, int first, sizei count`)		
`mode = POINTS,LINES,LINE_STRIP,LINE_LOOP`	✓	✓
`mode = TRIANGLES,TRIANGLE_STRIP,TRIANGLE_FAN`	✓	✓
`mode = QUADS,QUAD_STRIP,POLYGON`	–	–
DrawElements(`enum mode, sizei count, enum type, const void *indices`)		
`mode = POINTS,LINES,LINE_STRIP,LINE_LOOP`	✓	✓
`mode = TRIANGLES,TRIANGLE_STRIP,TRIANGLE_FAN`	✓	✓
`mode = QUADS,QUAD_STRIP,POLYGON`	–	–
`type = UNSIGNED_BYTE,UNSIGNED_SHORT`	✓	✓
`type = UNSIGNED_INT`	–	–
MultiDrawArrays(`enum mode, int *first, sizei *count, sizei primcount`)	–	–
MultiDrawElements(`enum mode, sizei *count, enum type, void **indices, sizei primcount`)	–	–

OpenGL 1.5	Common	Common-Lite
InterleavedArrays(`enum format, sizei stride, const void *pointer`)	–	–
DrawRangeElements(`enum mode, uint start, uint end, sizei count, enum type, const void *indices`)	–	–
ClientActiveTexture(`enum texture`)	✓	✓
EnableClientState(`enum cap`)		
`cap = TEXTURE_COORD_ARRAY,COLOR_ARRAY`	✓	✓
`cap = NORMAL_ARRAY,VERTEX_ARRAY`	✓	✓
`cap = EDGE_FLAG_ARRAY,INDEX_ARRAY`	–	–
`cap = FOG_COORD_ARRAY,SECONDARY_COLOR_ARRAY`	–	–
DisableClientState(`enum cap`)		
`cap = TEXTURE_COORD_ARRAY,COLOR_ARRAY`	✓	✓
`cap = NORMAL_ARRAY,VERTEX_ARRAY`	✓	✓
`cap = EDGE_FLAG_ARRAY, INDEX_ARRAY`	–	–
`cap = FOG_COORD_ARRAY,SECONDARY_COLOR_ARRAY`	–	–

■ `Float` types are supported for all-around generality, `short` and `byte` types are supported for space efficiency. Four-component vertex and texture coordinates are supported to allow an application to fully specify post-projection vertex and texture coordinates before division by w or q. Support for indexed vertex arrays allows for greater reuse of coordinate data between multiple faces, that is, when the shared edges are smooth. The indexing support is limited to `ubyte` and `ushort` indices since there is typically enough locality in the vertex array data to address the vertices with these more compact index types.

The OpenGL 1.5 specification defines the initial type for each of the arrays to be `FLOAT` for the common profile and `FIXED` for the common-lite profile.

Multitexture with a minimum of two texture units is required by OpenGL ES 1.1. ❑

2.9 Buffer Objects

The vertex data arrays described in Section 2.8 are stored in client memory. It is sometimes desirable to store frequently used client data, such as vertex array data in high-performance server memory. GL buffer objects provide a mechanism that clients can use to allocate, initialize and render from memory. Buffer objects can be used to store vertex array and element index data.

OpenGL 1.5	Common	Common-Lite
BindBuffer(`enum target, uint buffer`)	✓	✓
DeleteBuffers(`sizei n, const uint *buffers`)	✓	✓
GenBuffers(`sizei n, uint *buffers`)	✓	✓
BufferData(`enum target, sizeiptr size, const void *data, enum usage`)	✓	✓
BufferSubData(`enum target, intptr offset, sizeiptr size, const void *data`)	✓	✓
MapBuffer(`enum target, enum access`)	–	–
UnmapBuffer(`enum target`)	–	–

Name	**Type**	**Initial Value**	**Legal Values**
BUFFER_SIZE	integer	0	any non-negative integer
BUFFER_USAGE	enum	STATIC_DRAW	STATIC_DRAW, DYNAMIC_DRAW
BUFFER_ACCESS	enum	WRITE_ONLY	WRITE_ONLY
BUFFER_MAPPED	boolean	FALSE	FALSE

Table 2.2: Buffer object parameters and their values

■ The STREAM_COPY, STREAM_READ, STATIC_COPY, STATIC_READ, DYNAMIC_COPY, and DYNAMIC_-READ tokens and the **MapBuffer** and **UnmapBuffer** functions are not supported because it may not be possible for an application to read or get a pointer to the vertex data from the vertex buffers in server memory.

BufferData and BufferSubData define two new types that will work well on 64-bit systems, analogous to C's ”intptr_t”. The new type ”GLintptrARB” should be used in place of GLint whenever it is expected that values might exceed 2 billion. The new type ”GLsizeiptrARB” should be used in place of GLsizei whenever it is expected that counts might exceed 2 billion. Both types are defined as signed integers large enough to contain any pointer value. As a result, they naturally scale to larger numbers of bits on systems with 64-bit or even larger pointers. ❑

2.10 Rectangles

The commands for directly specifying rectangles are not supported.

OpenGL 1.5	**Common**	**Common-Lite**
Rect{**sifd**}(T x1, T y1, T x2, T y2)	–	–
Rect{**sifd**}**v**(T v1[2], T v2[2])	–	–

■ The rectangle commands are not used enough in applications to justify maintaining a redundant mechanism for drawing a rectangle. ❑

2.11 Coordinate Transformations

The full transformation pipeline is supported with the following exceptions: no support for specification of double-precision matrices and transformation parameters; no support for the transpose form of the **LoadMatrix** and **MultMatrix** commands; no support for COLOR matrix; and no support for texture coordinate generation. The double-precision only commands **DepthRange**, **Frustum**, and **Ortho** are replaced with single-precision or fixed-point variants from the OES_single_precision and OES_fixed_point extensions. The minimum depth of the MODELVIEW matrix stack is changed from 32 to 16.

OpenGL 1.5	**Common**	**Common-Lite**
DepthRange(clampd n, clampd f)	◊	†
Viewport(int x, int y, sizei w, sizei h)	✓	✓
MatrixMode(enum mode)		
mode = MODELVIEW,PROJECTION,TEXTURE	✓	✓
mode = COLOR	–	–

OpenGL 1.5	**Common**	**Common-Lite**
LoadMatrixf(`float m[16]`)	✓	†
LoadMatrixd(`double m[16]`)	–	–
MultMatrixf(`float m[16]`)	✓	†
MultMatrixd(`double m[16]`)	–	–
LoadTransposeMatrix{**fd**}(`T m[16]`)	–	–
MultTransposeMatrix{**fd**}(`T m[16]`)	–	–
LoadIdentity(`void`)	✓	✓
Rotatef(`float angle, float x, float y, float z`)	✓	†
Rotated(`double angle, double x, double y, double z`)	–	–
Scalef(`float x, float y, float z`)	✓	†
Scaled(`double x, double y, double z`)	–	–
Translatef(`float x, float y, float z`)	✓	†
Translated(`double x, double y, double z`)	–	–
Frustum(`double l, double r, double b, double t, double n, double f`)	♢	†
Ortho(`double l, double r, double b, double t, double n, double f`)	♢	†
ActiveTexture(`enum texture`)	✓	✓
PushMatrix(`void`)		
`TEXTURE` and `PROJECTION` (2 deep)	✓	✓
`MODELVIEW` (16 deep)	✓	✓
PopMatrix(`void`)	✓	✓
Enable/Disable(`RESCALE_NORMAL`)	✓	✓
Enable/Disable(`NORMALIZE`)	✓	✓
TexGen{**ifd**}**[v]**(`enum coord, enum pname, T param`)	–	–
GetTexGen{**ifd**}**v**(`enum coord, enum pname, T *params`)	–	–
Enable/Disable(`TEXTURE_GEN_`{`STRQ`})	–	–

■ The double-precision version of the transform commands are not necessary when there is a single precision version. The matrix stacks and convenience functions for computing rotations, scales, and translations, as well as projection matrices are kept in their entirety since they are used by a large number of of applications. The minimum depth for the modelview stack is reduced from 32 to 16 to reduce the storage requirements somewhat. The projection and texture stack depths are already limited to a depth of two. The non-transpose form of the matrix load and multiply commands are retained over the transpose versions to maximize compatibility with existing programming practices.

The viewport and depth range commands are supported since they provide necessary application control over where primitives are drawn. While texture coordinate generation is useful, it is considered too much of an implementation burden (applications can implement it to some extent themselves). Texgen is a strong candidate for the next revision. Both normalization and rescaling of normals are supported since normalization is deemed necessary and rescaling can be implemented using normalization minimizing implementation burden. ❑

2.12 Clipping

Primitives are clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by

$$-w_c <= x_c <= w_c$$

$$-w_c <= y_c <= w_c$$

$$-w_c <= z_c <= w_c$$

This view volume may be further restricted by as many as *n* client-defined clip planes to generate the clip volume. *n* is an implementation defined maximum that must be at least 1.

OpenGL 1.5	**Common**	**Common-Lite**
ClipPlane(`enum plane, const double *equation`)	♢	†
GetClipPlane(`enum plane, double *equation`)	♢	†
Enable/Disable(`CLIP_PLANE{0...n-1}`)	✓	✓

■ User-specified clipping planes are used predominantly in engineering and scientific applications. However, a single clipping plane is useful for some ”portal-culling” algorithms. ❑

2.13 Current Raster Position

The concept of the current raster position for positioning pixel rectangles and bitmaps is not supported. Current raster state and commands for setting the raster position are not supported.

OpenGL 1.5	**Common**	**Common-Lite**
RasterPos{**2,3,4**}{**sifd**}**[v]**(`T coords`)	–	–
WindowPos{**2,3**}{**sifd**}**[v]**(`T coords`)	–	–

■ Bitmaps and pixel image primitives are not supported so there is no need to specify the raster position. ❑

2.14 Colors and Coloring

The OpenGL 1.5 lighting model is supported with the following exceptions: no support for the color index lighting, secondary color, different front and back materials, local viewer, or color material mode other than `AMBIENT_AND_DIFFUSE`.

Directional, positional, and spot lights are all supported. An implementation must support a minimum of 8 lights. The **Material** command cannot independently change the front and back face properties, so the result is that materials always have the same front and back properties. Two-sided lighting is supported, though the front and back material properties used in the lighting computation will also be equal. The **ColorMaterial** command is not supported, so the color material mode cannot be changed from the default `AMBIENT_AND_DIFFUSE` mode, though `COLOR_MATERIAL` can be enabled in this mode. Neither local viewing computations nor separate specular color computation can be enabled using the **LightModel** command, therefore only the OpenGL 1.5 default infinite viewer and single color computational models are supported. Smooth and flat shading are fully supported for all primitives.

OpenGL 1.5	**Common**	**Common-Lite**
FrontFace(enum mode)	✓	✓
Enable/Disable(LIGHTING)	✓	✓
Enable/Disable(LIGHT{0-7})	✓	✓
Materialf[v](enum face, enum pname, T param)		
face = FRONT_AND_BACK	✓	†
face = FRONT,BACK	–	–
pname = AMBIENT,DIFFUSE,SPECULAR,EMISSION,SHININESS	✓	†
pname = AMBIENT_AND_DIFFUSE	✓	†
pname = COLOR_INDEXES	–	–
Materiali[v](enum face, enum pname, T param)	–	–
GetMaterialfv(enum face, enum pname, T *params)	✓	†
GetMaterialiv(enum face, enum pname, T *params)	–	–
Lightf[v](enum light, enum pname, T param)	✓	†
Lighti[v](enum light, enum pname, T param)	–	–
GetLightfv(enum light, enum pname, T *params)	✓	†
GetLightiv(enum light, enum pname, T *params)	–	–
LightModelf[v](enum pname, T param)		
pname = LIGHT_MODEL_TWO_SIDE	✓	†
pname = LIGHT_MODEL_AMBIENT	✓	†
pname = LIGHT_MODEL_COLOR_CONTROL	–	–
pname = LIGHT_MODEL_LOCAL_VIEWER	–	–
LightModeli[v](enum pname, T param)	–	–
Enable/Disable(COLOR_MATERIAL)	✓‡	✓‡
ColorMaterial(enum face, enum mode)	–	–
ShadeModel(enum mode)	✓	✓

■ Lighting is a desirable feature, so as much as possible is included in the Common and Common-Lite profiles. The minimum number of lights is not reduced since reducing it only saves memory for the state and the savings is not significant unless it is greatly reduced. The number cannot be greatly reduced (e.g., to 1 or 2) as many applications need three or more lights. Support for secondary color creates a non-trivial burden in the rasterization stage of the pipeline so it is not included. Local viewer increases the amount of computation in the lighting pipeline and is not widely used (usually because of the performance degradation), the other features controlled by the **LightModel** (scene ambient and two-sided lighting) are retained. Scene ambient is retained since its default value is non-zero and there would be no method to disable its effect if it were not included. Two-sided lighting is retained in a simplified fashion – the front and back material values must always be equal. To ensure this, only FRONT_AND_BACK can be used as the face parameter.

The most common use for the **ColorMaterial** functionality is to change the ambient and diffuse coefficients of the material. Since this is the default mode of the command, the **ColorMaterial** command is not included, but the ability to enable and disable it is, so the net effect is that only the ambient and diffuse material parameters can be modified. ❑

Chapter 3

Rasterization

3.1 Invariance

The invariance rules are retained in full.

3.2 Antialiasing

Multisampling is supported though an implementation is not required to provide a multisample buffer.

OpenGL 1.5	Common	Common-Lite
Enable/Disable(`MULTISAMPLE`)	✓	✓

■ Multisampling is a desirable feature. Since an implementation need not provide an actual multisample buffer and the command overhead is low, it is included. ❑

3.3 Points

Aliased and antialiased points are fully supported. The requested point size can also be multiplied with a distance attenuation factor, clamped to a specified point size range, and further clamped to the implementation dependent point size range to produce the derived point size. Details of how to do distance attenuation of point size is described in section 3.3 of the OpenGL 1.5 specification.

OpenGL 1.5	Common	Common-Lite
PointSize(`float size`)	✓	†
PointParameterf[v](`enum pname, T param`)	✓	†
PointParameteri[v](`enum pname, T param`)	–	–
Enable/Disable(`POINT_SMOOTH`)	✓	✓

■ See below. ❑

OpenGL 1.5	**Common**	**Common-Lite**
LineWidth(`float width`)	✓	†
Enable/Disable(`LINE_SMOOTH`)	✓	✓
LineStipple(`int factor, ushort pattern`)	–	–
Enable/Disable(`LINE_STIPPLE`)	–	–

3.4 Line Segments

Aliased and antialiased lines are fully supported. Line stippling is not supported.

■ Antialiasing is important for visual quality, particularly for devices with low spatial resolution (pixels per mm). Some antialiasing can be implemented within the application using 2D textures, but antialiasing is used by enough applications that it should be in the profile rather than something left to the application. The OpenGL 1.5 point and line antialiasing requirements provide substantial implementation latitude. In particular, only size/width 1.0 is required to be supported and the coverage computation constraints are easily satisfied. Line stippling is also used by ”presentation graphics” and engineering applications. It can be implemented by the application, and the implementation cost is considered too high to include in the profile. ❑

3.5 Polygons

Polygonal geometry support is reduced to triangle strips, triangle fans and independent triangles. All rasterization modes are supported except for point and line **PolygonMode** and antialiased polygons using polygon smooth. Depth offset is supported in `FILL` mode only.

OpenGL 1.5	**Common**	**Common-Lite**
CullFace(`enum mode`)	✓	✓
Enable/Disable(`CULL_FACE`)	✓	✓

Enable/Disable(`POLYGON_SMOOTH`)	–	–
PolygonStipple(`const ubyte *mask`)	–	–
GetPolygonStipple(`ubyte *mask`)	–	–
Enable/Disable(`POLYGON_STIPPLE`)	–	–
PolygonOffset(`float factor, float units`)	✓	†
Enable/Disable(`enum cap`)		
`cap = POLYGON_OFFSET_FILL`	✓	✓
`cap = POLYGON_OFFSET_LINE, POLYGON_OFFSET_POINT`	–	–

■ Support for all triangle types (independents, strips, fans) is not overly burdensome and each type has some desirable utility: strips for general performance and applicability, independents for efficiently specifying unshared vertex attributes, and fans for representing ”corner-turning” geometry. Face culling is important for eliminating unnecessary rasterization. Polygon stipple is desirable for doing patterned fills for ”presentation graphics”. It is also useful for transparency, but support for alpha is sufficient for that. Polygon stippling does represent a large burden for the polygon rasterization path and can usually be emulated using texture mapping and alpha test, so it is omitted. Polygon offset for filled triangles is necessary for rendering coplanar and outline polygons and if not present requires either stencil buffers or application tricks. Antialiased polygons using `POLYGON_SMOOTH` is just as desirable as antialiasing for other primitives, but is too large an implementation burden to include in the Common/Common-Lite profile. ❏

3.6 Pixel Rectangles

No support for directly drawing pixel rectangles is included. Limited **PixelStore** support is retained to allow different pack alignments for **ReadPixels** and unpack alignments for **TexImage2D**. **DrawPixels**, **PixelTransfer** modes and **PixelZoom** are not supported. The Imaging subset is not supported.

DrawPixels(sizei width, sizei height, enum format, enum type, void *data)	–	–
PixelZoom(float xfactor, float yfactor)	–	–

■ The OpenGL 1.5 specification includes substantial support for operating on pixel images. In the Common and Common-Lite profiles, the ability to draw pixel images is important, but with the constraint of minimizing the implementation burden. There is a concern that **DrawPixels** is often poorly implemented on hardware accelerators and that many applications are better served by emulating **DrawPixels** functionality by initializing a texture image with the host image and then drawing the texture image to a screen-aligned quadrilateral. This has the advantage of eliminating the **DrawPixels** processing path and and allows the image to be cached and drawn multiple times without re-transferring the image data from the application's address space. However, it requires extra processing by the application and the implementation, possibly requiring the image to be copied twice. The OES_draw_texture extension, added to OpenGL ES 1.1, addresses the above issues and provides an efficient mechanism to draw pixel images as textures.

The command **PixelStore** must be included to allow changing the pack alignment for **ReadPixels** and unpack alignment for **TexImage2D** to something other than the default value of 4 to support `ubyte` RGB image formats. The integer version of **PixelStore** is retained rather than the floating-point version since all parameters can be fully expressed using integer values. ❑

3.7 Bitmaps

Bitmap images are not supported.

OpenGL 1.5	Common	Common-Lite
Bitmap(`sizei width, sizei height, float xorig, float yorig, float xmove, float ymove, const ubyte *bitmap`)	–	–

■ The **Bitmap** command is useful for representing image data compactly and for positioning images directly in window coordinates. Since **DrawPixels** is not supported, the positioning functionality is not required. A strong enough case hasn't been made for the ability to represent font glyphs or other data more efficiently before transfer to the rendering pipeline. ❑

3.8 Texturing

1D textures, 3D textures, and cube maps are not supported. 2D textures are supported with the following exceptions: only a limited number of image format and type combinations are supported, listed in Table 3.1. Table 3.2 summarizes the disposition of all image types. The only internal formats supported are the base internal formats: `RGBA`, `RGB`, `LUMINANCE`, `ALPHA`, and `LUMINANCE_ALPHA`. The format must match the base internal format (no conversions from one format to another during texture image processing are supported) as described in Table 3.1. Texture borders are not supported (the **border** parameter must be zero, and an `INVALID_VALUE` error results if it is non-zero).

Internal Format	External Format	Type	Bytes per Pixel
RGBA	RGBA	UNSIGNED_BYTE	4
RGB	RGB	UNSIGNED_BYTE	3
RGBA	RGBA	UNSIGNED_SHORT_4_4_4_4	2
RGBA	RGBA	UNSIGNED_SHORT_5_5_5_1	2
RGB	RGB	UNSIGNED_SHORT_5_6_5	2
LUMINANCE_ALPHA	LUMINANCE_ALPHA	UNSIGNED_BYTE	2
LUMINANCE	LUMINANCE	UNSIGNED_BYTE	1
ALPHA	ALPHA	UNSIGNED_BYTE	1

Table 3.1: Texture Image Formats and Types

CopyTexture and **CopyTexSubImage** are supported. The internal format parameter can be any of the base internal formats described for **TexImage2D** subject to the constraint that color buffer components can be dropped during the conversion to the base internal format, but new components cannot be added. For example, an RGB color buffer can be used to create `LUMINANCE` or `RGB` textures, but not `ALPHA`, `LUMINANCE_ALPHA`, or `RGBA` textures. Table 3.3 summarizes the allowable framebuffer and base internal format combinations. If the framebuffer format is not compatible with the base texture format an `INVALID_OPERATION` error results.

A	✓	–	–	–	–
L	–	✓	–	–	–
LA	✓	✓	✓	–	–
RGB	–	✓	–	✓	–
RGBA	✓	✓	✓	✓	✓

Table 3.3: CopyTexture Internal Format/Color Buffer Combinations

Compressed textures are supported including sub-image specification; however, no method for reading back a compressed texture image is included, so implementation vendors must provide separate tools for creating compressed images. The generic compressed internal formats are not supported, so compression of textures using **TexImage2D** is not supported. The `OES_compressed_paletted_texture` extension defines several compressed texture formats.

Wrap modes `REPEAT` and `CLAMP_TO_EDGE` are supported, but not `CLAMP`, `CLAMP_TO_BORDER` and `MIRRORED_REPEAT`. Wrap mode for ”R” coordinate i.e. `TEXTURE_WRAP_R` is not supported. Texture priorities, LOD clamps, and explicit base and maximum level specification are not supported. The remaining OpenGL 1.5 texture parameters are supported including all filtering modes. Texture objects are supported, but proxy textures are not supported.

OpenGL ES 1.1 requires a minimum of two texture units to be supported.

■ Texturing with 2D images is a critical feature for entertainment, presentation, and engineering applications. 1D, 3D, and cube map textures are less important. Texture objects are required for managing multiple textures. In some applications packing multiple textures into a single large texture is necessary for performance, therefore subimage support is also included. Copying from the framebuffer is useful for many shading algorithms. A limited set of formats, types and internal formats is included. The RGB component ordering is always RGB or RGBA rather than BGRA since there is no real perceived advantage to using BGRA. Format conversions for copying from the framebuffer are more liberal than for images specified in application memory, since an application usually has control over images authored as part of the application, but has little control over the framebuffer format. Unsupported **CopyTexture** conversions generate an `INVALID_OPERATION` error, since the error is dependent on the presence of a particular color component in the colorbuffer. This behavior parallels the error treatment for attempts to read from a non-existent depth or stencil buffer.

Texture borders are not included, since they are often not completely supported by full OpenGL implementations. All filter modes are supported since they represent a useful set of quality and speed options. Edge clamp and repeat wrap modes are both supported since these are most commonly used. Texture priorities are not supported since they are seldom used by applications. Similarly, the ability to control the LOD range and the base and maximum mipmap image levels is not included, since these features are used by a narrow set of applications. Since all of the supported texture parameters are scalar valued, the vector form of the parameter command is eliminated.

Auto mipmap generation has been added to OpenGL ES 1.1 since it can offload the application from having to generate mip-levels. Hardware implementations can potentially accelerate auto mip-level generation especially for video textures or when rendering to texture.

A texture is considered incomplete in OpenGL ES if the set of mipmap arrays are not specified with the same type. The check for completeness is done when a given texture is used to render geometry.

Compressed textures are important for reducing space and bandwidth requirements. The OpenGL 1.5 compression infrastructure is retained (for 2D textures) and a simple palette-based compression format is added as a required profile extension. ❑

3.8.1 Texture Environments and Texture Functions

All OpenGL 1.5 texture environments except for the texture crossbar are supported.

COMBINE_RGB	Texture Function
REPLACE	$Arg0$
MODULATE	$Arg0 * Arg1$
ADD	$Arg0 + Arg1$
ADD_SIGNED	$Arg0 + Arg1 - 0.5$
INTERPOLATE	$Arg0 * Arg2 + Arg1 * (1 - Arg2)$
SUBTRACT	$Arg0 - Arg1$
DOT3_RGB	$4 \times ((Arg0_r - 0.5) * (Arg1_r - 0.5) + (Arg0_g - 0.5) * (Arg1_g - 0.5) + (Arg0_b - 0.5) * (Arg1_b - 0.5))$
DOT3_RGBA	$4 \times ((Arg0_r - 0.5) * (Arg1_r - 0.5) + (Arg0_g - 0.5) * (Arg1_g - 0.5) + (Arg0_b - 0.5) * (Arg1_b - 0.5))$

COMBINE_ALPHA	Texture Function
REPLACE	$Arg0$
MODULATE	$Arg0 * Arg1$
ADD	$Arg0 + Arg1$
ADD_SIGNED	$Arg0 + Arg1 - 0.5$
INTERPOLATE	$Arg0 * Arg2 + Arg1 * (1 - Arg2)$
SUBTRACT	$Arg0 - Arg1$

Table 3.4: COMBINE texture functions. The scalar expression computed for the DOT3_RGB and DOT3_RGBA functions is placed into each of the 3 (RGB) or 4 (RGBA) components of the output. The result generated from COMBINE_ALPHA is ignored for DOT3_RGBA.

SRC*n*_RGB	OPERAND*n*_RGB	Argument
TEXTURE	SRC_COLOR	C_s
	ONE_MINUS_SRC_COLOR	$1 - C_s$
	SRC_ALPHA	A_s
	ONE_MINUS_SRC_ALPHA	$1 - A_s$
CONSTANT	SRC_COLOR	C_c
	ONE_MINUS_SRC_COLOR	$1 - C_c$

	ONE_MINUS_SRC_ALPHA	$1 - A_f$
PREVIOUS	SRC_ALPHA	A_p
	ONE_MINUS_SRC_ALPHA	$1 - A_p$

Table 3.6: Arguments for COMBINE_ALPHA functions.

3.9 Fog

Fog is fully supported except for FOG_COORD_SRC and color index related modes.

OpenGL 1.5	**Common**	**Common-Lite**
Fogf[v](`enum pname, T param`)		
pname = `FOG_MODE`,`FOG_DENSITY`,`FOG_START`,`FOG_END`,`FOG_COLOR`	✓	†
pname = `FOG_INDEX`	–	–
pname = `FOG_COORD_SRC`	–	–
Fogi[v](`enum pname, T param`)	–	–
Enable/Disable(`FOG`)	✓	✓

■ Fog is useful for entertainment applications as a way to manage frame rate while hiding drawing mistakes. It can be emulated using texturing, but is often needed in applications that already use texturing for other purposes. Fog does present an implementation burden, but is used in enough applications to justify inclusion. Implementations can reduce the computational burden by computing fog values at each vertex rather than each pixel. ❏

Chapter 4

Per-Fragment Operations and the Framebuffer

4.1 Per-Fragment Operations

All OpenGL 1.5 per-fragment operations are supported, except for color index related operations and the imaging subset additions (**BlendColor** and **BlendEquation**). Depth and stencil operations are supported, but a selected config is not required to include a depth or stencil buffer.

OpenGL 1.5	**Common**	**Common-Lite**
Enable/Disable(`SCISSOR_TEST`)	✓	✓
Scissor(`int x, int y, sizei width, sizei height`)	✓	✓
Enable/Disable(`SAMPLE_COVERAGE`)	✓	✓
Enable/Disable(`SAMPLE_ALPHA_TO_COVERAGE`)	✓	✓
Enable/Disable(`SAMPLE_ALPHA_TO_ONE`)	✓	✓
SampleCoverage(`clampf value, boolean invert`)	✓	†
Enable/Disable(`ALPHA_TEST`)	✓	✓
AlphaFunc(`enum func, clampf ref`)	✓	†
Enable/Disable(`STENCIL_TEST`)	✓	✓
StencilFunc(`enum func, int ref, uint mask`)	✓	✓
StencilMask(`uint mask`)	✓	✓
StencilOp(`enum fail, enum zfail, enum zpass`)	✓	✓
Enable/Disable(`DEPTH_TEST`)	✓	✓
DepthFunc(`enum func`)	✓	✓
DepthMask(`boolean flag`)	✓	✓
Enable/Disable(`BLEND`)	✓	✓
BlendFunc(`enum sfactor, enum dfactor`)	✓	✓

OpenGL 1.5	**Common**	**Common-Lite**
BlendFuncSeparate(`enum srcRGB, enum dstRGB, enum srcAlpha, enum dstAlpha`)	–	–
BlendEquation(`enum mode`)	–	–
BlendColor(`clampf red, clampf green, clampf blue, clampf alpha`)	–	–
Enable/Disable(`DITHER`)	✓	✓
Enable/Disable(`INDEX_LOGIC_OP`)	–	–
Enable/Disable(`COLOR_LOGIC_OP`)	✓	✓
LogicOp(`enum opcode`)	✓	✓
BeginQuery(`enum target, uint id`)	–	–
EndQuery(`enum target`)	–	–
GenQueries(`sizei n, uint *ids`)	–	–
DeleteQueries(`sizei n, uint *ids`)	–	–

■ Scissor is useful for providing complete control over where pixels are drawn and some form of window/drawing-surface scissoring is typically present in most rasterizers so the cost is small. Alpha testing is useful for early rejection of transparent pixels and for some kinds of keying. Stenciling is useful for drawing with masks and for a number of presentation effects and an implementation is not required to support a stencil buffer (just the API and the correct behavior when not present). Depth buffering is essential for many 3D applications and the profile should require some form of depth buffer to be present. Blending is necessary for implementing transparency, color sums, and some other useful rendering effects. Dithering is useful on displays with low color resolution, and the inclusion doesn't require dithering to be implemented in the renderer. Logic op is useful for efficient highlighting operations. Masked operations are supported since they are often used in more complex operations and are needed to achieve invariance. Support for blend equations other than add and blend color would be useful, but are only included in the Imaging Subset of OpenGL 1.5 so they are not included. ❑

4.2 Whole Framebuffer Operations

All whole framebuffer operations are supported except for color index related operations, drawing to different color buffers, and accumulation buffer.

OpenGL 1.5	**Common**	**Common-Lite**
DrawBuffer(`enum mode`)	–	–
IndexMask(`uint mask`)	–	–
ColorMask(`boolean red, boolean green, boolean blue, boolean alpha`)	✓	✓
Clear(`bitfield mask`)	✓	✓
ClearColor(`clampf red, clampf green, clampf blue, clampf alpha`)	✓	†
ClearIndex(`float c`)	–	–

OpenGL 1.5	Common	Common-Lite
ClearDepth(`clampd depth`)	♢	†
ClearStencil(`int s`)	✓	✓
ClearAccum(`float red, float green, float blue, float alpha`)	–	–
Accum(`enum op, float value`)	–	–

■ Multiple drawing buffers are not exposed; an application can only draw to the default buffer, so **DrawBuffer** is not necessary. The accumulation buffer is not used in many applications, though it is useful as a non-interactive antialiasing technique. ❑

4.3 Drawing, Reading, and Copying Pixels

ReadPixels is supported with the following exceptions: the depth and stencil buffers cannot be read from and the number of format and type combinations for **ReadPixels** is severely restricted. Two format/type combinations are supported: format `RGBA` and type `UNSIGNED_BYTE` for portability; and one implementation-specific format/type combination queried using the tokens `IMPLEMENTATION_COLOR_READ_FORMAT_OES` and `IMPLEMENTATION_COLOR_READ_TYPE_OES` (`OES_read_format` extension). The format and type combinations that can be returned from these queries are listed in Table 3.1. **CopyPixels** and **ReadBuffer** are not supported. Read operations return data from the default color buffer.

OpenGL 1.5	Common	Common-Lite
ReadBuffer(`enum mode`)	–	–
ReadPixels(`int x, int y,sizei width, sizei height, enum format, enum type, void *pixels`)	✓‡	✓‡
CopyPixels(`int x, int y, sizei width, sizei height, enum type`)	–	–

■ Reading the color buffer is useful for some applications and also provides a platform independent method for testing. The inclusion of the `OES_read_format` extension allows an implementation to support a more efficient format without increasing the number of formats that must be supported. Pixel copies can be implemented by reading to the host and then drawing to the color buffer (using texture mapping for the drawing part). Image copy performance is important to many presentation applications, so **CopyPixels** may be revisited in a future revision. Drawing to and reading from the depth and stencil buffers is not used frequently in applications (though it would be convenient for testing), so it is not included. **ReadBuffer** is not required since the concept of multiple drawing buffers is not exposed. ❑

Chapter 5

Special Functions

5.1 Evaluators

Evaluators are not supported.

OpenGL 1.5	Common	Common-Lite
Map1{**fd**}(`enum target, T u1, T u2, int stride, int order, T points`)	–	–
Map2{**fd**}(`enum target, T u1, T u2, int ustride, int uorder, T v1, T v2, int vstride, int vorder, T *points`)	–	–
GetMap{**ifd**}**v**(`enum target, enum query, T *v`)	–	–
EvalCoord{**12**}{**fd**}**[v]**(`T coord`)	–	–
MapGrid1{**fd**}(`int un, T u1, T u2`)	–	–
MapGrid2{**fd**}(`int un, T u1, T u2, T v1, T v2`)	–	–
EvalMesh1(`enum mode, int i1, int i2`)	–	–
EvalMesh2(`enum mode, int i1, int i2, int j1, int j2`)	–	–
EvalPoint1(`int i`)	–	–
EvalPoint2(`int i, int j`)	–	–

■ Evaluators are not used by many applications other than sophisticated CAD applications. ❑

5.2 Selection

Selection is not supported.

OpenGL 1.5	Common	Common-Lite
InitNames(`void`)	–	–
LoadName(`uint name`)	–	–
PushName(`uint name`)	–	–
PopName(`void`)	–	–
RenderMode(`enum mode`)	–	–
SelectBuffer(`sizei size, uint *buffer`)	–	–

■ Selection is not used by many applications. There are other methods that applications can use to implement picking operations. ❑

5.3 Feedback

Feedback is not supported.

OpenGL 1.5	Common	Common-Lite
FeedbackBuffer(`sizei size, enum type, float *buffer`)	–	–
PassThrough(`float token`)	–	–

■ Feedback is seldom used. ❑

5.4 Display Lists

Display lists are not supported.

OpenGL 1.5	Common	Common-Lite
NewList(`uint list, enum mode`)	–	–
EndList(`void`)	–	–
CallList(`uint list`)	–	–
CallLists(`sizei n, enum type, const void *lists`)	–	–
ListBase(`uint base`)	–	–
GenLists(`sizei range`)	–	–
IsList(`uint list`)	–	–
DeleteLists(`uint list, sizei range`)	–	–

■ Display lists are used by many applications — sometimes to achieve better performance and sometimes for convenience. The implementation complexity associated with display lists is too large for the implementation targets envisioned for this profile. ❑

5.5 Flush and Finish

Flush and **Finish** are supported.

OpenGL 1.5	Common	Common-Lite
Flush(`void`)	✓	✓
Finish(`void`)	✓	✓

■ Applications need some manner to guarantee rendering has completed, so **Finish** needs to be supported. **Flush** can be trivially supported. ❑

5.6 Hints

Hints are retained except for the hints relating to the unsupported polygon smoothing and compression of textures (including retrieving compressed textures) features.

OpenGL 1.5	**Common**	**Common-Lite**
Hint(`enum target, enum mode`)		
`target = PERSPECTIVE_CORRECTION_HINT`	✓	✓
`target = POINT_SMOOTH_HINT`	✓	✓
`target = LINE_SMOOTH_HINT`	✓	✓
`target = FOG_HINT`	✓	✓
`target = TEXTURE_COMPRESSION_HINT`	–	–
`target = POLYGON_SMOOTH_HINT`	–	–
`target = GENERATE_MIPMAP_HINT`	✓	✓

■ Applications and implementations still need some method for expressing permissible speed versus quality trade-offs. The implementation cost is minimal. There is no value in retaining the hints for unsupported features. ❑

Chapter 6

State and State Requests

6.1 Querying GL State

State queries are supported for *static* and *dynamic* state explicitly supported in the profile. The supported GL state queries can be categorized into simple queries, enumerated queries, texture queries, pointer and string queries, and buffer object queries.

The values of the strings returned by **GetString** are specified as part of the profile definition. In particular, the version string indicates the particular OpenGL ES profile as well as the version of that profile. Strings are listed in Table 6.1.

As the profile is revised, the `VERSION` string is updated to indicate the revision. The string format is fixed and includes a two-character profile identifier: `CM` for the Common and `CL` for the Common-Lite profile; and the two-digit version number (`X.Y`).

Strings	
`VENDOR`	as defined by OpenGL 1.5
`RENDERER`	as defined by OpenGL 1.5
`VERSION`	”`OpenGL ES-XX 1.1`” `XX`={`CM`,`CL`}
`EXTENSIONS`	as defined by OpenGL 1.5

Table 6.1: String State

Client and server attribute stacks are not supported by the profiles; consequently, the commands **PushAttrib**, **PopAttrib**, **PushClientAttrib**, and **PopClientAttrib** are not supported. Gets are supported by the profiles to allow an application to save and restore dynamic state.

OpenGL 1.5	**Common**	**Common-Lite**
GetBooleanv(`enum pname, boolean *params`)	✓	✓
GetIntegerv(`enum pname, int *params`)	✓	✓
GetFloatv(`enum pname, float *params`)	✓	†
GetDoublev(`enum pname, double *params`)	–	–
IsEnabled(`enum cap`)	✓	✓
GetClipPlane(`enum plane, double eqn[4]`)	–	–
GetClipPlanef(`enum plane, float eqn[4]`)	♢	†
GetLightfv(`enum light, enum pname, float *params`)	✓	†
GetLightiv(`enum light, enum pname, int *params`)	–	–
GetMaterialfv(`enum face, enum pname, float *params`)	✓	†
GetMaterialiv(`enum face, enum pname, int *params`)	–	–
GetTexEnv{if}v(`enum env, enum pname, T *params`)	✓	†
GetTexGen{ifd}v(`enum env, enum pname, T *params`)	–	–
GetTexParameter{if}v(`enum target, enum pname, T *params`)	✓	†
GetTexLevelParameter{if}v(`enum target, int lod, enum pname, T *params`)	–	–
GetPixelMap{ui us f}v(`enum map, T data`)	–	–
GetMap{ifd}v(`enum map, enum value, T data`)	–	–
GetBufferParameteriv(`enum target, enum pname, boolean *params`)	✓	✓
GetTexImage(`enum tex, int lod, enum format, enum type, void *img`)	–	–
GetCompressedTexImage(`enum tex, int lod, void *img`)	–	–
IsTexture(`uint texture`)	✓	✓
GetPolygonStipple(`void *pattern`)	–	–
GetColorTable(`enum target, enum format, enum type, void *table`)	–	–
GetColorTableParameter{if}v(`enum target, enum pname, T params`)	–	–
GetPointerv(`enum pname, void **params`)	✓	✓
GetString(`enum name`)	✓	✓
IsQuery(`uint id`)	–	–
GetQueryiv(`enum target, enum pname, int *params`)	–	–
GetQueryObjectiv(`uint id, enum pname, int *params`)	–	–
GetQueryObjectuiv(`uint id, enum pname, uint *params`)	–	–
IsBuffer(`uint buffer`)	✓	✓
GetBufferSubData(`enum target, intptr offset, sizeiptr size, void *data`)	–	–
GetBufferPointerv(`enum target, enum pname, void **params`)	–	–

OpenGL 1.5	**Common**	**Common-Lite**
PushAttrib(`bitfield mask`)	–	–
PopAttrib(`void`)	–	–
PushClientAttrib(`bitfield mask`)	–	–
PopClientAttrib(`void`)	–	–

■ There are several reasons why one type or another of internal state needs to be queried by an application. The application may need to dynamically discover implementation limits (pixel component sizes, texture dimensions, etc.), or the application might be part of a layered library and it may need to save and restore any state that it disturbs as part of its rendering. **PushAttrib** and **PopAttrib** can be used to perform this but they are expensive to implement in hardware since we need an attribute stack depth greater than 1. An attribute stack depth of 4 was proposed but was rejected because an application would still have to handle stack overflow which was considered unacceptable. Gets can be efficiently implemented if the implementation shadows states on the CPU. Gets also allow an infinite stack depth so an application will never have to worry about stack overflow errors. The string queries are retained as they provide important versioning, and extension information. ❏

6.2 State Tables

The following tables summarize state that is present in the Common and Common-Lite profiles. State appearing in *italic* indicates unnamed state. All state has initial values identical to those specified in OpenGL 1.5.

State	**Exposed**	**Queriable**	**Common Get**	**Common-Lite Get**
Begin/end object	–	–	–	–
Previous line vertex	✓	–	–	–
First line-vertex flag	✓	–	–	–
First vertex of line loop	✓	–	–	–
Line stipple counter	–	–	–	–
Polygon vertices	–	–	–	–
Number of polygon vertices	–	–	–	–
Previous two triangle strip vertices	✓	–	–	–
Number of triangle strip vertices	✓	–	–	–
Triangle strip A/B pointer	✓	–	–	–
Quad vertices	–	–	–	–
Number of quad strip vertices	–	–	–	–

Table 6.29: Core Additions and Extensions

Chapter 7

Core Additions and Extensions

An OpenGL ES profile consists of two parts: a subset of the full OpenGL pipeline, and some extended functionality that is drawn from a set of OpenGL ES-specific extensions to the full OpenGL specification. Each extension is pruned to match the profile's command subset and added to the profile as either a core addition or a profile extension. Core additions differ from profile extensions in that the commands and tokens do not include extension suffixes in their names.

Profile extensions are further divided into required (mandatory) and optional extensions. Required extensions must be implemented as part of a conforming implementation, whereas the implementation of optional extensions is left to the discretion of the implementor. Both types of extensions use extension suffixes as part of their names, are present in the `EXTENSIONS` string, and participate in function address queries defined in the platform embedding layer. Required extensions have the additional packaging constraint, that commands defined as part of a required extension must also be available as part of a static binding if core commands are also available in a static binding. The commands comprising an optional extension may optionally be included as part of a static binding.

From an API perspective, commands and tokens comprising a core addition are indistinguishable from the original OpenGL subset. However, to increase application portability, an implementation may also implement a core addition as an extension by including suffixed versions of commands and tokens in the appropriate dynamic and optional static bindings and the extension name in the `EXTENSIONS` string.

■ Extensions preserve all traditional extension properties regardless of whether they are required or optional. Required extensions must be present; therefore, additionally providing static bindings simplifies application usage and reinforces the ubiquity of the extension. Permitting core additions to be included as extensions allows extensions that are promoted to core additions in later profile revisions to continue to be available as extensions, retaining application compatibility. ❑

The Common and Common-Lite profiles add subsets of the `OES_byte_coordinates`, `OES_fixed_point`, `OES_single_precision` and `OES_matrix_get` ES-specific extensions as core additions; `OES_read_format`, `OES_compressed_paletted_texture`, `OES_point_size_array` and `OES_point_sprite` as required profile extensions; and `OES_matrix_palette` and `OES_draw_texture` as optional profile extensions.

The `OES_query_matrix` optional extension in OpenGL ES 1.0 has been deprecated in OpenGL ES 1.1. The various matrices in GL can be obtained by calling the fixed, float version of get or by using the `OES_matrix_get` core extension.

Extension Name	**Common**	**Common-Lite**
`OES_byte_coordinates`	core addition	core addition
`OES_fixed_point`	core addition	core addition
`OES_single_precision`	core addition	n/a
`OES_matrix_get`	core addition	core addition
`OES_read_format`	required extension	required extension
`OES_compressed_paletted_texture`	required extension	required extension
`OES_point_size_array`	required extension	required extension
`OES_point_sprite`	required extension	required extension
`OES_matrix_palette`	optional extension	optional extension
`OES_draw_texture`	optional extension	optional extension

Table 7.1: OES Extension Disposition

7.1 Byte Coordinates

The `OES_byte_coordinates` extension allows `byte` data types to be used as vertex and texture coordinates. The Common/Common-Lite profile supports `byte` coordinates in vertex array commands.

7.2 Fixed Point

The `OES_fixed_point` extension defines an integer fixed-point data type for vertex attributes and command parameters. The extension specification includes commands that parallel all OpenGL 1.5 commands with floating-point parameters (including commands that support a single parameter type version such as **DepthRange**, **PointSize**, and **LineWidth**). The subset of commands included in the Common and Common-Lite profiles matches exactly the subset of floating-point commands included in the Common profile. The subset of commands is summarized in Table 7.2

Normal3x`(fixed coords)`
MultiTexCoord4x`(fixed coords)`
Color4x`(fixed coords)`
VertexPointer`(int size, enum type, sizei stride, const void *ptr)` `size = 2,3,4 type = FIXED`
ColorPointer`(int size, enum type, sizei stride, const void *ptr)` `size=3,4 type = FIXED`
NormalPointer`(enum type, sizei stride, const void *ptr)` `type = FIXED`
TexCoordPointer`(int size, enum type, sizei stride, const void *ptr)` `size = 2,3,4 type = FIXED`
DepthRangex`(clampx n, clampx f)`
LoadMatrixx`(fixed m[16])`
MultMatrixx`(fixed m[16])`
Rotatex`(fixed angle, fixed x, fixed y, fixed z)`

Scalex(`fixed x, fixed y, fixed z`)
Translatex(`fixed x, fixed y, fixed z`)
Frustumx(`fixed l, fixed r, fixed b, fixed t, fixed n, fixed f`)
Orthox(`fixed l, fixed r, fixed b, fixed t, fixed n, fixed f`)
ClipPlanex(`enum plane, const fixed *equation`)
Materialx[v](`enum face, enum pname, T param`)
Lightx[v](`enum light, enum pname, T param`)
LightModelx[v](`enum pname, T param`)
PointParameterx[v](`enum pname, T param`)
PointSizex(`fixed size`)
LineWidthx(`fixed width`)
PolygonOffsetx(`fixed factor, fixed units`)
TexParameterx(`enum target, enum pname, T param`)
TexEnvx[v](`enum target, enum pname, T param`)
Fogx[v](`enum pname, T param`)
SampleCoveragex(`clampx value, boolean invert`)
AlphaFuncx(`enum func, clampx ref`)
ClearColorx(`clampx red, clampx green, clampx blue, clampx alpha`)
ClearDepthx(`clampx depth`)
GetFixedxv(`enum pname, T *params`)
GetClipPlanex(`enum pname, T eqn[4]`)
GetLightxv(`enum light, enum pname, T *params`)
GetMaterialxv(`enum face, enum pname, T *params`)
GetTexEnvxv(`enum env, enum pname, T *params`)
GetTexParameterxv(`enum target, enum pname, T *params`)

Table 7.2: Common/Common-Lite profile subset of `OES_fixed_point`

7.3 Single-precision Commands

The `OES_single_precision_commands` extension creates new single-precision parameter command variants of commands that have no such variants (**DepthRange**, **TexGen**, **Frustum**, **Ortho**, etc.). Only the subset matching the profile feature set is included in the Common profile.

DepthRangef(`clampf n, clampf f`)
Frustumf(`float l, float r, float b, float t, float n, float f`)
Orthof(`float l, float r, float b, float t, float n, float f`)
ClearDepthf(`clampf depth`)

```
GetClipPlanef(enum pname, float eqn[4])
```

7.4 Compressed Paletted Texture

The `OES_compressed_paletted_texture` extension provides a method for specifying a compressed texture image as a color index image accompanied by a palette. The extension adds ten new texture internal formats to specify different combinations of index width and palette color format: `PALETTE4_RGB8_OES`, `PALETTE4_RGBA8_OES`, `PALETTE4_R5_G6_B5_OES`, `PALETTE4_RGBA4_OES`, `PALETTE4_RGB5_A1_OES`, `PALETTE8_RGB8_OES`, `PALETTE8_RGBA8_OES`, `PALETTE8_R5_G6_B5_OES`, `PALETTE8_RGBA4_OES`, and `PALETTE8_RGB5_A1_OES`. The state queries for `NUM_COMPRESSED_TEXTURE_FORMATS` and `COMPRESSED_TEXTURE_FORMATS` include these formats.

7.5 Read Format

The `OES_read_format` extension allows implementation-specific pixel type and format parameters to be queried by an application and used in **ReadPixel** commands. The format and type values must be from the set of supported texture image format and type values specified in Table 3.1.

7.6 Matrix Palette

The optional `OES_matrix_palette` extension adds the ability to support vertex skinning in OpenGL ES. This extension allow OpenGL ES to support a palette of matrices. The matrix palette defines a set of matrices that can be used to transform a vertex. The matrix palette is not part of the model view matrix stack and is enabled by setting the MATRIX_MODE to MATRIX_PALETTE_OES.

The n vertex units use a palette of m modelview matrices (where n and m are constrained to implementation defined maxima). Each vertex has a set of n indices into the palette, and a corresponding set of n weights. Matrix indices and weights can be changed for each vertex.

When this extension is utilized, the enabled units transform each vertex by the modelview matrices specified by the vertices' respective indices. These results are subsequently scaled by the weights of the respective units and then summed to create the eyespace vertex.

7.7 Point Sprites

The `OES_point_sprites` extension provides a method for application to draw particles using points instead of quads. This extension also allows an app to specify texture coordinates that are interpolated across the point instead of the same texture coordinate used by traditional GL points.

7.8 Point Size Array

This `OES_point_size_array` extension extends how points and point sprites are rendered by allowing an array of point sizes instead of a fixed input point size given by PointSize. This provides flexibility for applications to do particle effects.

The vertex arrays will be extended to include a point size array. The point size array can be enabled/disabled via POINT_SIZE_ARRAY_OES. The point size array, if enabled, controls the sizes used to render points and point sprites. If point size array is enabled, the point size defined by PointSize is ignored. The point sizes supplied in the point size arrays will be the sizes used to render both points and point sprites.

Distance-based attenuation works in conjunction with POINT_SIZE_ARRAY_OES. If distance-based attenuation is enabled the point size from the point size array will be attenuated as defined by point parameters to compute the final point size.

7.9 Matrix Get

Many applications require the ability to be able to read the GL matrices. OpenGL ES 1.1 will allow an application to read the matrices using the GetFloatv command for the common profile and the GetFixedv command for the common-lite profile.

In cases where the common-lite implementation stores matrices and performs matrix operations internally using floating point (example would be OpenGL ES implementations that support JSR184 etc.) the GL cannot return the floating pt matrix elements since the float data type is not supported by the common-lite profile. Using GetFixedv to get the matrix data will result in a loss of information.

To take care of this issue, new tokens are proposed by this extension. These tokens will allow the GL to return a representation of the floating pt matrix elements as as an array of integers, according to the IEEE 754 floating pt ”single format” bit layout.

7.10 Draw Texture

This `OES_draw_texture` extension defines a mechanism for writing pixel rectangles from one or more textures to a rectangular region of the screen. This capability is useful for fast rendering of background paintings, bitmapped font glyphs, and 2D framing elements in games

Chapter 8

Packaging

8.1 Header Files

The header file structure is the same as in a full OpenGL distribution, using a single header file: `gl.h`. Additional enumerants `VERSION_ES_CM_x_y` and `VERSION_ES_CL_x_y`, where `x` and `y` are the major and minor version numbers as described in Section 6.1, are included in the header file. These enumerants indicate the versions of profiles supported at compile-time.

8.2 Libraries

Each profile defines a distinct link-library. The library name includes the profile name as `libGLES_nn.z` where `nn` is either `CM` or `CL` and `.z` is a platform-specific library suffix (i.e., `.a`, `.so`, `.lib`, etc.). The symbols for the platform-specific embedding library are also included in the link-library. Availability of static and dynamic function bindings is platform dependent. Rules regarding the export of bindings for core additions, required profile extensions, and optional platform extensions are described in Chapter 7.

Appendix A

Acknowledgements

The OpenGL ES Common and Common-Lite profiles are the result of the contributions of many people, representing a cross section of the desktop, hand-held, and embedded computer industry. Following is a partial list of the contributors, including the company that they represented at the time of their contribution:

Aaftab Munshi, ATI

Andy Methley, Panasonic

Axel Mamode, Sony Computer Entertainment

    Kari Pulli, Nokia (kari.pulli ’at’ nokia.com)

Status

    Ratified by the Khronos BOP, July 23, 2003.

Version

    $Date: 2003/07/23 04:23:25 $ $Revision: 1.5 $

Number

    291

Dependencies

    OpenGL 1.1 is required.

Overview

    This extension allows specifying, additionally to all existing
    values, byte-valued vertex and texture coordinates to be used.

    The main reason for introducing the byte-argument is to allow
    storing data more compactly on memory-restricted environments.
```

```
IP Status

    There is no intellectual property associated with this extension.

Issues

    None known.

New Procedures and Functions

    None

New Tokens

    Accepted by the <type> parameter of VertexPointer and TexCoordPointer

    BYTE     0x1400

Additions to Chapter 2 of the OpenGL 1.3 Specification (OpenGL Operation)

    Add signed byte entry points to first paragraph of
    section 2.7 (Vertex Specification):

            void Vertex{234}bOES( T coords );
            void Vertex{234}bvOES( T coords );

    and to the second paragraph:

            void TexCoord{1234}bOES( T coords );
            void TexCoord{1234}bvOES( T coords );

    and to the third paragraph:

            void MultiTexCoord{1234}bOES( enum texture, T coords );
            void MultiTexCoord{1234}bvOES( enum texture, T coords );

    Add byte to supported types in Table 2.4 (Vertex Array Sizes):

        Command         Sizes   Types
        VertexPointer   2,3,4   byte,short,int,float,double
        TexCoordPointer 1,2,3,4 byte,short,int,float,double

Additions to Chapter 3 of the OpenGL 1.3 Specification (Rasterization)

    None

Additions to Chapter 4 of the OpenGL 1.3 Specification (Per-Fragment
Operations and the Frame Buffer)

    None

    The extension is written against the OpenGL 1.3 Specification.

Overview

    This extension provides the capability, for platforms that do
    not have efficient floating-point support, to input data in a
    fixed-point format, i.e.,  a scaled-integer format.  There are
    several ways a platform could try to solve the problem, such as
    using integer only commands, but there are many OpenGL commands
    that have only floating-point or double-precision floating-point
    parameters.  Also, it is likely that any credible application
    running on such a platform will need to perform some computations
    and will already be using some form of fixed-point representation.
    This extension solves the problem by adding new ‘‘fixed’, and
    ‘‘clamp fixed’’  data types based on a a two’s complement
    S15.16 representation.  New versions of commands are created
    with an ’x’ suffix that take fixed or clampx parameters.

IP Status

    None
```

```
Issues

*   Add double-precision (S31.32) form too?
      NO

*   Additional InterleavedArray formats?
      NO

*   Should newly suffixed commands, e.g., PointSize, get an alias with
    a float or double suffix for consistency?
      NO

*   Are enums converted to fixed by scaling by 2^16.
      NO.  An enums are passed through as if they are already in
      S15.16 form.  Requiring scaling is too error prone.

New Procedures and Functions

    NOTE:  'T' expands to 'const fixed*' or 'fixed' as appropriate

    void Vertex{234}x[v]OES(T coords);
    void Normal3x[v]OES(T coords);

FIXED_OES 0x140C

Additions to Chapter 2 of the OpenGL 1.3 Specification (OpenGL Operation)

Section 2.1.1 Floating-Point Computation

Add the following paragraphs:

On some platforms, floating-point computations are not sufficiently well supported to be used in an OpenGL implementation. On such platforms, fixed-point representations may be a viable substitute for floating-point. Internal computations can use either fixed-point or floating-point arithmetic. Fixed-point computations must be accurate to within +/-2ˆ-15. The maximum representable magnitude for a fixed-point number used to represent positional or normal coordinates must be at least 2ˆ15; the maximum representable magnitude for colors or texture coordinates must be at least 2ˆ10. The maximum representable magnitude for all other fixed-point values must be at least 2ˆ15. x*0 = 0*x = 0. 1*x = x*1 = x. x + 0 = 0 + x = x. 0ˆ0 = 1. Fixed-point computations may lead to overflows or underflows. The results of such computations are undefined, but must not lead to GL interruption or termination.

Section 2.3 GL Command Syntax

Paragraph 3 is updated to include the ’x’ suffix and

Table 2.1 is modified to include the row:

x	fixed

Table 2.2 is modified to include the rows:

fixed	32	signed 2’s complement S15.16 scaled integer
clampx	32	S15.16 scaled integer clamped to [0, 1]

and the count of the number of rows in the text is changed to 16.

Add paragraph

The mapping of GL data types to data types of a specific language binding are part of the language binding definition and

```
      may be platform-dependent.  Type conversion and type promotion
      behavior when mixing actual and formal arguments of different
      data types are specific to the language binding and platform.
      For example, the C language includes automatic conversion
      between integer and floating-point data types, but does not
      include automatic conversion between the int and fixed or
      float and fixed GL types since the fixed data type is not a
      distinct built-in type.  Regardless of language binding,
      the enum type converts to fixed-point without scaling and
      integer types are converted by multiplying by 2^16.

    Section 2.7 Vertex Specification

      Commands are revised to included 'x' suffix.

    Section 2.8 Vertex Arrays

      Table 2.4 Vertex Array Sizes is revised to include the 'fixed' type
      for all commands except EdgeFlagPointer.

      References to Vertex command suffixes are revised to include 'x'.

    Section 2.9 Rectangles

      Revise to include 'x' suffix.

    Section 2.10 Coordinate Transformations

      Revise to include 'x' suffix.  Section 2.10.1 describes clampx.
      Add alternate suffixed versions of Ortho and Frustum.

    Section 2.11 Clipping

      Add alternate suffixed version of ClipPlane.

    Section 2.12 Current Raster Position

      Revise to include 'x' suffix.

    Section 2.13 Colors and Coloring

      Revise to include 'x' suffix and
      Table 2.6 is modified to include row:

      ---------------
      | fixed |  c  |
      ---------------

Additions to Chapter 3 of the OpenGL 1.3 Specification (Rasterization)
```

```
    Section 3.3 Points

      Add alternate suffixed PointSize command.

    Section 3.4 Line Segments

      Add alternate suffixed LineWidth command.

    Section 3.5 Polygons

      Add alternate suffixed PolygonOffset command.

    Section 3.6 Pixel Rectangles

      Revise to include ’x’ suffix on PixelStore, PixelTransfer, PixelMap,
      ConvolutionParameter.

      Table 3.5 is modified to include row:

      ----------------------
      | FIXED | fixed | No |
      ----------------------

      Add alternate suffixed PixelZoom to Section 3.6.5

    Section 3.7 Bitmaps

      Add alternate suffixed Bitmap command.

    Section 3.8 Texturing

      Revise to include ’x’ suffix in TexParameter (Section 3.8.4).

      Add alternate suffixed PrioritizeTextures command (Section 3.8.11).

      Revise to include ’x’ suffix in TexEnv (Section 3.8.12).

    Section 3.10 Fog

      Revise to include ;x; suffix in Fog command.

Additions to Chapter 4 of the OpenGL 1.3 Specification (Per-Fragment
Operations and the Frame Buffer)

    Section 4.1 Fragment Operations

      Add alternate suffixed SampleCoverage command (Section 4.1.3),
      AlphaFunc command (Section 4.1.4), BlendColor command (Section 4.1.7).

    Section 4.2 Whole Framebuffer Operations
```

```
      Add alternate suffixed ClearColor, ClearDepth, and ClearAccum commands
      (Section 4.2.3).

      Add alternate suffixed Accum command (Section 4.2.4).

Additions to Chapter 5 of the OpenGL 1.3 Specification (Special Functions)

    Section 5.1 Evaluators

      Revise to include 'x' suffix on Map1, Map2, Map1Grid, and Map2Grid
      commands.

    Section 5.3 Feedback

      Add alternate suffixed FeedbackBuffer and PassThrough commands.
      Revise Figure 5.2 to indicate 'f' values may also be 'x' values.

Additions to Chapter 6 of the OpenGL 1.3 Specification (State and
State Requests)

      Add GetFixedv to Section 6.1.1.  Revise Section 6.1.2 to
      include implied conversions for GetFixedv.

      Revise to include 'x' suffix for GetClipPlane, GetLightm GetMaterial,
      GetTexEnv, GetTexGen, GetTexParameter, GetTexLevelParameter,
      GetPixelMap, and GetMap in Section 6.1.3.

      Revise to include 'x' suffix for GetHistogramParameter (Section 6.1.9).

    Section 6.2 State Tables

      Revise intro paragraph to include GetFixedv.

Revision History

    12/15/2002    0.1
        - Original draft.

    03/31/2003    0.2
        - Corrected a typo in GetClipPlanex and FIXED_OES.

    04/24/2003    0.3
        - Added clarification that enums must be converted to fixed
          by scaling when passed in a fixed parameter type.  Corrected
          some typos.

    05/29/2003    0.4
        - Changed enums to be passed unscaled when passed to a
          fixed formal parameter.

    07/08/2003    0.5
        - Removed bogus Dependencies on section
        - Added extension number and enumerant value
    07/11/2003    0.6
        - Added OES suffixes

    07/12/2003    0.7
        - Added note about GLX protocol

    06/16/2004    0.8
        - Added ClipPlanex, and various Get functions

Dependencies

    None
    The extension is written against the OpenGL 1.3 Specification.

Overview

    This extension adds commands with single-precision floating-point
    parameters corresponding to the commands that only variants that
    accept double-precision floating-point input.  This allows an
    application to avoid using double-precision floating-point
    data types.  New commands are added with an ’f’ prefix.

IP Status

    None

Issues

*   An alternative is to suggest platforms define GLfloat and
    GLdouble to be the same type, since it is unlikely that both
    single- and double-precision are required at the same time.

    Resolved: This might create additional confusion, so it is
```

better to define new commands.

New Procedures and Functions

```
    void DepthRangefOES(clampf n, clampf f);
    void FrustumfOES(float l, float r, float b, float t, float n, float f);
    void OrthofOES(float l, float r, float b, float t, float n, float f);

    void ClipPlanefOES(enum plane, const float* equation);
    void GetClipPlanefOES(enum plane, float* equation);

    void void glClearDepthfOES(clampd depth);
```

GLX Protocol

    Five new GL rendering commands are added. The following commands
    are sent to the server as part of a glXRender request:

        ClearDepthfOES
            2           8               rendering command length
            2           4308            rendering command opcode
            4           FLOAT32         z

        DepthRangefOES
            2           12              rendering command length
            2           4309            rendering command opcode
            4           FLOAT32         n
            4           FLOAT32         f

        FrustumfOES
            2           28              rendering command length
            2           4310            rendering command opcode
            4           FLOAT32         l
            4           FLOAT32         r
            4           FLOAT32         b
            4           FLOAT32         t
            4           FLOAT32         n
            4           FLOAT32         f
        OrthofOES
            2           28              rendering command length
            2           4311            rendering command opcode
            4           FLOAT32         l
            4           FLOAT32         r
            4           FLOAT32         b
            4           FLOAT32         t
            4           FLOAT32         n
            4           FLOAT32         f

        ClipPlanefOES
            2           24              rendering command length
            2           4312            rendering command opcode
            4           ENUM            plane
            4           FLOAT32         v[0]
            4           FLOAT32         v[1]
            4           FLOAT32         v[2]
            4           FLOAT32         v[3]

    The remaining commands are non-rendering commands.  These commands are
    sent separately (i.e., not as part of a glXRender or glXRenderLarge
    request), using the glXVendorPrivateWithReply request:

        GetClipPlanefOES
            1           CARD8           opcode (X assigned)
            1           17              GLX opcode (glXVendorPrivateWithReply)
            2           4               request length
            4           1421            vendor specific opcode
            4           GLX_CONTEXT_TAG context tag
            4           ENUM            plane
          =>
            1           1               reply
            1                           unused
            2           CARD16          sequence number
            4           0               reply length
            4           FLOAT32         v[0]
            4           FLOAT32         v[1]
            4           FLOAT32         v[2]
            4           FLOAT32         v[3]
            8                           unused

Dependencies

    None
    The extension is written against the OpenGL 1.3 Specification.

Overview

    This extension provides the capability to query an OpenGL
    implementation for a preferred type and format combination
    for use with reading the color buffer with the ReadPixels
    command.  The purpose is to enable embedded implementations
    to support a greatly reduced set of type/format combinations
    and provide a mechanism for applications to determine which
    implementation-specific combination is supported.

    Section 4.3 Drawing, Reading, and Copying Pixels

      Section 4.3.2 Reading Pixels

      (add paragraph)
      A single format and type combination, designated the
      preferred format, is associated with the state variables
      IMPLEMENTATION_COLOR_READ_FORMAT_OES and
      IMPLEMENTATION_COLOR_READ_TYPE_OES.  The preferred format
      indicates a read format type combination that provides optimal
      performance for a particular implementation.  The state values
      are chosen from the set of regularly accepted format
      and type parameters as shown in tables 3.6 and 3.5.

    296

Dependencies

    OpenGL 1.3 is required.
    OES_fixed_point is required.

Overview

    Many applications may need to query the contents and status of the
    current matrix at least for debugging purposes, especially as the
    implementations are allowed to implement matrix machinery either in
    any (possibly proprietary) floating point format, or in a fixed point
    format that has the range and accuracy of at least 16.16 (signed 16 bit
    integer part, unsigned 16 bit fractional part).

    This extension is intended to allow application to query the components
    of the matrix and also their status, regardless whether the internal
    representation is in fixed point or floating point.

IP Status

    There is no intellectual property associated with this extension.

Issues

    None known.
```

```
New Procedures and Functions

    GLbitfield glQueryMatrixxOES( GLfixed mantissa[16],
                                  GLint   exponent[16] )

    mantissa[16] contains the contents of the current matrix in GLfixed
    format.  exponent[16] contains the unbiased exponents applied to the
    matrix components, so that the internal representation of component i
    is close to mantissa[i] * 2^exponent[i].  The function returns a status
    word which is zero if all the components are valid. If
    status & (1<<i) != 0, the component i is invalid (e.g., NaN, Inf).
    The implementations are not required to keep track of overflows.  In
    that case, the invalid bits are never set.

    294

Dependencies

    Written based on the wording of the OpenGL ES 1.0 specification

Overview

    The goal of this extension is to allow direct support of palettized
    textures in OpenGL ES.

    Palettized textures are implemented in OpenGL ES using the
    CompressedTexImage2D call. The definition of the following parameters
    "level" and "internalformat" in the CompressedTexImage2D call have
    been extended to support paletted textures.

    A paletted texture is described by the following data:
        palette format
            can be R5_G6_B5, RGBA4, RGB5_A1, RGB8, or RGBA8

        number of bits to represent texture data
            can be 4 bits or 8 bits per texel.  The number of bits
            also detemine the size of the palette.  For 4 bits/texel
            the palette size is 16 entries and for 8 bits/texel the
            palette size will be 256 entries.

            The palette format and bits/texel are encoded in the
            "level" parameter.

        palette data and texture mip-levels
            The palette data followed by all necessary mip levels are
            passed in "data" parameter of CompressedTexImage2D.

            The size of palette is given by palette format and bits / texel.
            A palette format of RGB_565 with 4 bits/texel imply a palette
            size of 2 bytes/palette entry * 16 entries = 32 bytes.

            The level value is used to indicate how many mip levels
            are described.  Negative level values are used to define
            the number of miplevels described in the "data" component.
            A level of zero indicates a single mip-level.

Issues

    *   Should glCompressedTexSubImage2D be allowed for modifying paletted
        texture data.

        RESOLVED:  No, this would then require implementations that do not
        support paletted formats internally to also store the palette
        per texture.  This can be a memory overhead on platforms that are
        memory constrained.

    *   Should palette format and number of bits used to represent each
        texel be part of data or internal format.

        RESOLVED:  Should be part of the internal format since this makes
        the palette format and texture data size very explicit for the
        application programmer.

    *   Should the size of palette be fixed i.e 16 entries for 4-bit texels
        and 256 entries for 8-bit texels or be programmable.

        RESOLVED:  Should be fixed.  The application can expand the palette
        to 16 or 256 if internally it is using a smaller palette.

New Procedures and Functions
```

New Tokens

    Accepted by the <level> parameter of CompressedTexImage2D

        Zero and negative values. |level| + 1 determines the number of
        mip levels defined for the paletted texture.

    Accepted by the <internalformat> paramter of CompressedTexImage2D

PALETTE4_RGB8_OES	0x8B90
PALETTE4_RGBA8_OES	0x8B91
PALETTE4_R5_G6_B5_OES	0x8B92
PALETTE4_RGBA4_OES	0x8B93
PALETTE4_RGB5_A1_OES	0x8B94
PALETTE8_RGB8_OES	0x8B95
PALETTE8_RGBA8_OES	0x8B96
PALETTE8_R5_G6_B5_OES	0x8B97
PALETTE8_RGBA4_OES	0x8B98
PALETTE8_RGB5_A1_OES	0x8B99

Additions to Chapter 2 of the OpenGL 1.3 Specification (OpenGL Operation)

    None

Additions to Chapter 3 of the OpenGL 1.3 Specification (Rasterization)

    Add to Table 3.17: Specific Compressed Internal Formats

Compressed Internal Format	Base Internal Format
PALETTE4_RGB8_OES	RGB
PALETTE4_RGBA8_OES	RGBA
PALETTE4_R5_G6_B5_OES	RGB
PALETTE4_RGBA4_OES	RGBA
PALETTE4_RGB5_A1_OES	RGBA
PALETTE8_RGB8_OES	RGB
PALETTE8_RGBA8_OES	RGBA
PALETTE8_R5_G6_B5_OES	RGB
PALETTE8_RGBA4_OES	RGBA
PALETTE8_RGB5_A1_OES	RGBA

    Add to Section 3.8.3, Alternate Image Specification

    If <internalformat> is PALETTE4_RGB8, PALETTE4_RGBA8, PALETTE4_R5_G6_B5,
    PALETTE4_RGBA4, PALETTE4_RGB5_A1, PALETTE8_RGB8, PALETTE8_RGBA8,
    PALETTE8_R5_G6_B5, PALETTE8_RGBA4 or PALETTE8_RGB5_A1, the compressed
    texture is a compressed paletted texture. The texture data contains the

```
    palette data following by the mip-levels where the number of mip-levels
    stored is given by |level| + 1.  The number of bits that represent a
    texel is 4 bits if <interalformat> is given by PALETTE4_xxx and is 8
    bits if <internalformat> is given by PALETTE8_xxx.

    Compressed paletted textures support only 2D images without
    borders. CompressedTexImage2D will produce an INVALID_OPERATION
    error if <border> is non-zero.

    To determine palette format refer to tables 3.10 and 3.11 of Chapter
    3 where the data ordering for different <type> formats are described.

    Add table 3.17.1:  Texel Data Formats for compressed paletted textures

    PALETTE4_xxx:

         7 6 5 4 3 2 1 0
         ---------------
        |  1st  |  2nd  |
        | texel | texel |
         ---------------

    PALETTE8_xxx

     31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
     ---------------------------------------------------------------------------------------
    |        1st            |         2nd            |         3rd          |     4th       |
    |        texel          |         texel          |         texel        |    texel      |
     ---------------------------------------------------------------------------------------

Errors

    INVALID_OPERATION is generated by TexImage2D, CompressedTexSubImage2D,
    CopyTexSubImage2D if <internalformat> is PALETTE4_RGB8_OES,
    PALETTE4_RGBA8_OES, PALETTE4_R5_G6_B5_OES, PALETTE4_RGBA4_OES,
    PALETTE4_RGB5_A1_OES, PALETTE8_RG8_OES, PALETTE8_RGBA8_OES,
    PALETTE8_R5_G6_B5_OES, PALETTE8_RGBA4_OES, or PALETTE8_RGB5_A1_OES.

    INVALID_VALUE is generated by CompressedTexImage2D if
    if <internalformat> is PALETTE4_RGB8_OES, PALETTE4_RGBA8_OES,
    PALETTE4_R5_G6_B5_OES, PALETTE4_RGBA4_OES, PALETTE4_RGB5_A1_OES,
    PALETTE8_RGB8_OES, PALETTE8_RGBA8_OES, PALETTE8_R5_G6_B5_OES,
    PALETTE8_RGBA4_OES, or PALETTE8_RGB5_A1_OES and <level> value is
    neither zero or a negative value.

New State

    The queries for NUM_COMPRESSED_TEXTURE_FORMATS and
    COMPRESSED_TEXTURE_FORMATS include these ten new formats.

Status

    Ratified by the Khronos BOP, Aug 5, 2004.

Version

Number

Dependencies

    OpenGL ES 1.0 is required.

Overview

    This extension adds the ability to support vertex skinning in OpenGL ES.
    A simplified version of the ARB_matrix_palette extension is used to
    define OES_matrix_palette extension.

    This extension allow OpenGL ES to support a palette of matrices.  The matrix
    palette defines a set of matrices that can be used to transform a vertex.
    The matrix palette is not part of the model view matrix stack and is enabled
    by setting the MATRIX_MODE to MATRIX_PALETTE_OES.

    The n vertex units use a palette of m modelview matrices (where n and m are
    constrained to implementation defined maxima.)  Each vertex has a set of n
    indices into the palette, and a corresponding set of n weights.
    Matrix indices and weights can be changed for each vertex.

    When this extension is utilized, the enabled units transform each
    vertex by the modelview matrices specified by the vertices'
    respective indices.  These results are subsequently scaled by the
    weights of the respective units and then summed to create the
    eyespace vertex.

    A similar procedure is followed for normals.  Normals, however,
    are transformed by the inverse transpose of the modelview matrix.
```

```
IP Status

    Unknown, but believed to be none.

Issues

    Should this extension be an optional or mandatory extension

        Will be an optional extension since ARB_matrix_palette didn't
        see much usage in OpenGL.

    Should we allow the ability to load the current model view matrix
    into the matrix palette

        Yes.  This will be very helpful since it makes it very easy
        to load an object heirarchy.  This will also be helpful for JSR184

    Should the Matrix palette be loaded with a new LoadMatrixPalette
    command?

        No, although this provides an easy way to support arbitrary
        palette sizes, the method loses the current (MultMatrix,
        Rotate, Translate, Scale..) matrix functionality.

        Matrices will be Loaded into the palette with current
        functions when MATRIX_MODE is MATRIX_PALETTE_OES.  The current
        palette index is set by an explicit command:
        CurrentPaletteMatrixARB().

    Should the Matrix Palette have a stack?

        Not required, this wastes a lot of space.

    Should the matrix palette be gettable?

        No.

    Should MatrixIndexARB be changed to imply LoadMatrix calls to the
    applicable MODELVIEW_MATRIXn stacks?

        No, the MODELVIEW_MATRIXn matrices are unused when
        MATRIX_PALETTE is enabled.

    Should there be a way to specify that the modelview matrices
    for two different vertex units are identical?

        Not explicitly, but indexing the matrix palette provides this
        functionality. (Both units will have the same matrix index.)
```

```
New Procedures and Functions

    void CurrentPaletteMatrixOES(uint index)

    void LoadPaletteFromModelViewMatrixOES()

    void MatrixIndexPointerOES(int size, enum type, sizei stride, void *pointer)

    void WeightPointerOES(int size, enum type, sizei stride, void *pointer);

New Tokens

    Accepted by the <mode> parameter of MatrixMode, and by the
    <cap> parameters of Enable and Disable:

      MATRIX_PALETTE_OES                  0x8840

    Accepted by the <pname> parameters of GetIntegerv:

      MAX_PALETTE_MATRICES_OES            0x8842
      MAX_VERTEX_UNITS_OES                0x86A4

    The default values for MAX_PALETTE_MATRICES_OES and MAX_VERTEX_UNITS_OES
    are 9 and 3 resp.

    Accepted by the <cap> parameters of EnableClientState and DisableClientState and
    by the <pname> parameter of IsEnabled:

      MATRIX_INDEX_ARRAY_OES              0x8844
      WEIGHT_ARRAY_OES                    0x86AD

    Accepted by the <pname> parameter of GetIntegerv:

      MATRIX_INDEX_ARRAY_SIZE_OES           0x8846
      MATRIX_INDEX_ARRAY_TYPE_OES           0x8847
      MATRIX_INDEX_ARRAY_STRIDE_OES         0x8848
      MATRIX_INDEX_ARRAY_BUFFER_BINDING_OES 0x8B9E

      WEIGHT_ARRAY_SIZE_OES                 0x86AB
      WEIGHT_ARRAY_TYPE_OES                 0x86A9
      WEIGHT_ARRAY_STRIDE_OES               0x86AA
      WEIGHT_ARRAY_BUFFER_BINDING_OES       0x889E

    Accepted by the <pname> parameter of GetPointerv:

      MATRIX_INDEX_ARRAY_POINTER_OES        0x8849
      WEIGHT_ARRAY_POINTER_OES              0x86AC

Additions to Chapter 2 of the OpenGL ES 1.0 Specification
```

```
- Added to section 2.8

      void WeightPointerOES(int size, enum type, sizei stride, void *pointer);

      void MatrixIndexPointerOES(int size, enum type, sizei stride, void *pointer);

    WeightPointerOES & MatrixIndexPointerOES are used to describe the weights and
    matrix indices used to blend corresponding matrices for a given vertex.

    For implementations supporting matrix palette, note that <size> values for
    WeightPointerOES & MatrixIndexPointerOES must be less than or equal to the
    implementation defined value MAX_VERTEX_UNITS_OES.

- Added to table in section 2.8

    Command                 Sizes                        Types
    -------                 -----                        -----
    WeightPointerOES        1..MAX_VERTEX_UNITS_OES      fixed, float
    MatrixIndexPointerOES   1..MAX_VERTEX_UNITS_OES      ubyte

- (section 2.8) Extend the cap flags passed to EnableClientState/DisableClientState
   to include

      MATRIX_INDEX_ARRAY_OES, or WEIGHT_ARRAY_OES

- (section 2.10) Add the following:

      "The vertex coordinates that are presented to the GL are termed
       object coordinates. The model-view matrix is applied to these
       coordinates to yield eye coordinates. In implementations with
       matrix palette, the matrices specified by the indices per vertex
       are applied to these coordinates and the weighted sum of the
       results are the eye coordinates. Then another matrix, called the
       projection matrix, is applied to eye coordinates to yield clip
       coordinates.  A perspective division is carried out on clip
       coordinates to yield normalized device coordinates.

       A final viewport transformation is applied to convert these
       coordinates into window coordinates."

      "... the vertex's eye coordinates are found as:

        (xe)    n-1               (xo)
        (ye)  =  SUM  w_i * M_i * (yo)
        (ze)    i=0               (zo)
        (we)                      (wo)

      where M_i is the palette matrix associated with the i'th
      Vertex unit:

        M_i = MatrixPalette[MatrixIndex[i]],
                 if MATRIX_PALETTE_OES is enabled, and
        M_i = MODELVIEW_MATRIX, otherwise.

      w_i is the Vertex’s associated weight for vertex unit i:

        w_i = weight_i, if MATRIX_PALETTE_OES is enabled,
                     1, if MATRIX_PALETTE_OES is disabled,

      and,

        n = <size> value passed into glMatrixIndexPointerOES."

      "The projection matrix and model-view matrices are set
      with a variety of commands. The affected matrix is
      determined by the current matrix mode. The current
      matrix mode is set with

        void MatrixMode( enum mode );

      which takes one of the pre-defined constants TEXTURE,
      MODELVIEW, PROJECTION, MATRIX_PALETTE_OES.

      In implementations supporting OES_matrix_palette,

         void CurrentPaletteMatrixOES(uint index);

      defines which of the palette’s matrices is affected by
      subsequent matrix operations when the current matrix mode is
      MATRIX_PALETTE_OES. CurrentPaletteMatrixOES generates the
      error INVALID_VALUE if the <index> parameter is not between
      0 and MAX_PALETTE_MATRICES_OES - 1.

      In implementations supporting OES_matrix_palette,

         void LoadPaletteFromModelViewMatrixOES();

      copies the current model view matrix to a matrix in the matrix
      palette, specified by CurrentPaletteMatrixOES.

      "The state required to implement transformations consists of a
      four-valued integer indicating the current matrix mode, a
      stack of at least two 4 x 4 matrices for each of PROJECTION,
      and TEXTURE with associated stack pointers, a stack of at least
      32 4 x 4 matrices with an associated stack pointer for MODELVIEW,
      and a set of MAX_PALETTE_MATRICES_OES matrices of at least 9
      4 x 4 matrices each for the matrix palette.

      Initially, there is only one matrix on each stack, and all
      matrices are set to the identity.  The initial matrix mode
```

```
          is MODELVIEW.

          "When matrix palette is enabled, the normal is transformed
          to eye space by:

                                                n-1
              (nx' ny' nz') = (nx ny nz) Inv ( SUM w_i * Mu_i)
                                                i=0

            Alternatively implementations may choose to transform the
          normal to eye-space by:

                                n-1
              (nx' ny' nz') =  SUM w_i * (nx ny nz) Inv(Mu_i)
                                i=0

          where Mu_i is the upper leftmost 3x3 matrix taken from the
          modelview for vertex unit i (M_i),

               M_i = MatrixPalette[MatrixIndex[i]],
                         if MATRIX_PALETTE_OES is enabled, and
               M_i = MODELVIEW_MATRIX, otherwise

          otherwise.

          weight_i is the vertex's associated weight for vertex unit i,

              w_i = weight_i

          and

              n = <size> value passed into glMatrixIndexPointerOES."

Errors

      INVALID_VALUE is generated if the <size> parameter for
      MatrixIndexPointerOES or WeightPointerOES is greater
      than MAX_VERTEX_UNITS_OES.

      INVALID_VALUE is generated if the <count> parameter to
      CurrentPaletteMatrixOES is greater than MAX_PALETTE_MATRICES_OES - 1

New State

OpenGL ES 1.0 is required

Overview

    Applications such as particle systems have tended to use OpenGL quads
    rather than points to render their geometry, since they would like
    to use a custom-drawn texture for each particle, rather than the
    traditional OpenGL round antialiased points, and each fragment in
    a point has the same texture coordinates as every other fragment.

    Unfortunately, specifying the geometry for these quads can be
    expensive, since it quadruples the amount of geometry required, and
    may also require the application to do extra processing to compute
    the location of each vertex.

    The purpose of this extension is to allow such applications to use
    points rather than quads.  When GL_POINT_SPRITE_OES is enabled,
    the state of point antialiasing is ignored.  For each texture unit,
    the app can then specify whether to replace the existing texture
    coordinates with point sprite texture coordinates, which are
    interpolated across the point.
```

Issues

The following are the list of issues as discussed in the ARB_point_sprite extension. I’ve deleted issues that are not related to OpenGL ES such as vertex shader programs etc.

Tokens that use _ARB names are modified to use _OES.

* Should this spec say that point sprites get converted into quads?

  RESOLVED: No, this would make the spec much uglier, because then we’d have to say that polygon smooth and stipple get turned off, etc. Better to provide a formula for computing the texture coordinates and leave them as points.

* How are point sprite texture coordinates computed?

  RESOLVED: They move smoothly as the point moves around on the screen, even though the pixels touched by the point do not. The exact formula is given in the spec below.

  A point sprite can be thought of as a quad whose upper-left corner has (s,t) texture coordinates of (0,0) and whose lower-right corner has texture coordinates of (1,1), as illustrated in the following figure. In the figure "P" is the center of the point sprite, and "O" is the origin (0,0) of the window coordinate system. Note that the y window coordinate increases from bottom-to-top but the t texture coordinate of point sprites increases from top-to-bottom.

```
          ^
        +y| (0,0)
          |   +-----+
          |   |     |
          |   |  P  |
          |   |     |
          |   +-----+
          |       (1,1)
          |              +x
          O--------------->
```

  Applications using a single texture for both point sprites and other geometry need to account for the fixed coordinate mapping of point sprites.

* How do point sizes for point sprites work?

  RESOLVED: This specification treats point sprite sizes like antialiased point sizes, but with more leniency. Implementations may choose to not clamp the point size to the antialiased point size range. The set of point sprite sizes available must be a superset of the antialiased point sizes. However, whereas antialiased point sizes are all evenly spaced by the point size

```
    granularity, point sprites can have an arbitrary set of sizes.
    This lets implementations use, e.g., floating-point sizes.

*   Should there be a way to query the list of supported point sprite
    sizes?

    RESOLVED: No.  If an implementation were to use, say, a single-
    precision IEEE float to represent point sizes, the list would be
    rather long.

*   Do mipmaps apply to point sprites?

    RESOLVED: Yes.  They are similar to quads in this respect.

*   What of this extension’s state is per-texture unit and what
    of this extension’s state is state is global?

    RESOLVED: The GL_POINT_SPRITE_OES enable is global.  The
    COORD_REPLACE_OES state is per-texture unit (state set by TexEnv is
    per-texture unit).

*   Should there be a global on/off switch for point sprites, or
    should the per-unit enable imply that switch?

    RESOLVED: There is a global switch to turn it on and off.  This
    is probably more convenient for both driver and app, and it
    simplifies the spec.

*   What should the TexEnv mode for point sprites be called?

    RESOLVED: COORD_REPLACE_OES.

*   What is the interaction with multisample points, which are round?

    RESOLVED: Point sprites are rasterized as squares, even in
    multisample mode.  Leaving them as round points would make the
    feature useless.

*   How does this extension interact with the point size attenuation
    functionality in OES_point_parameters and OpenGL 1.4?

    RESOLVED:  Point sprites sizes are attenuated just like the sizes of
    non-sprite points.

*   How are point sprites clipped?

    RESOLVED:  Point sprites are transformed as points, and standard point
    clipping operations are performed.  This can cause point sprites that
    move off the edge of the screen to disappear abruptly, in the same way
    that regular points do.  As with any other primitive, standard
    per-fragment clipping operations (scissoring, window ownership test)
    still apply.
```

```
New Procedures and Functions

    None

New Tokens

    Accepted by the <cap> parameter of Enable, Disable, and by the
    <target> parameter of TexEnvf, TexEnvfv, TexEnvx, TexEnvxv:

        POINT_SPRITE_OES                                0x8861

    When the <target> parameter of TexEnvf, TexEnvfv, TexEnvx, TexEnvxv,
    is POINT_SPRITE_OES, then the value of <pname> may be:

        COORD_REPLACE_OES                               0x8862

    When the <target> and <pname> parameters of TexEnvf, TexEnvfv,
    TexEnvx, TexEnvxv, are POINT_SPRITE_OES and COORD_REPLACE_OES
    respectively, then the value of <param> or the value pointed
    to by <params> may be:

        FALSE
        TRUE

Additions to Chapter 2 of the OpenGL 1.4 Specification (OpenGL Operation)

    None.

Additions to Chapter 3 of the OpenGL 1.4 Specification (Rasterization)

    Insert the following paragraphs after the second paragraph of section
    3.3 (page 66):

    "Point sprites are enabled or disabled by calling Enable or Disable
    with the symbolic constant POINT_SPRITE_OES.  The default state is for
    point sprites to be disabled.  When point sprites are enabled, the
    state of the point antialiasing enable is ignored.

    The point sprite texture coordinate replacement mode is set with one
    of the commands

      void TexEnv{ixf}(enum target, enum pname, T param)
      void TexEnv{ixf}v(enum target, enum pname, const T *params)

    where target is POINT_SPRITE_OES and pname is COORD_REPLACE_OES.  The
    possible values for param are FALSE and TRUE.  The default value for
    each texture unit is for point sprite texture coordinate replacement
    to be disabled."

    Replace the first two sentences of the second paragraph of section
```

```
3.3.1 (page 67) with the following:

"The effect of a point width other than 1.0 depends on the state of
point antialiasing and point sprites.  If antialiasing and point
sprites are disabled, ..."

Replace the first sentences of the fourth paragraph of section 3.3.1
(page 68) with the following:

"If antialiasing is enabled and point sprites are disabled, ..."

Insert the following paragraphs at the end of section 3.3.1 (page
70):

"When point sprites are enabled, then point rasterization produces a
fragment for each framebuffer pixel whose center lies inside a square
centered at the point's (x_w, y_w), with side length equal to the
current point size.

All fragments produced in rasterizing a point sprite are assigned the
same associated data, which are those of the vertex corresponding to
the point, with texture coordinates s, t, and r replaced with s/q,
t/q, and r/q, respectively.  If q is less than or equal to zero, the
results are undefined.  However, for each texture unit where
COORD_REPLACE_OES is TRUE, these texture coordinates are replaced
with point sprite texture coordinates.  The s coordinate varies
from 0 to 1 across the point horizontally left-to-right, while
the t coordinate varies from 0 to 1 vertically top-to-bottom.
The r and q coordinates are replaced with the constants 0 and 1,
respectively.

The following formula is used to evaluate the s and t coordinates:

  s = 1/2 + (x_f + 1/2 - x_w) / size
  t = 1/2 - (y_f + 1/2 - y_w) / size

where size is the point's size, x_f and y_f are the (integral) window
coordinates of the fragment, and x_w and y_w are the exact, unrounded
window coordinates of the vertex for the point.

The widths supported for point sprites must be a superset of those
supported for antialiased points.  There is no requirement that these
widths must be equally spaced.  If an unsupported width is requested,
the nearest supported width is used instead."

Replace the text of section 3.3.2 (page 70) with the following:

"The state required to control point rasterization consists of the
floating-point point width, three floating-point values specifying
the minimum and maximum point size and the point fade threshold size,
three floating-point values specifying the distance attenuation
coefficients, a bit indicating whether or not antialiasing is
```

enabled, a bit indicating whether or not point sprites are enabled, and a bit for the point sprite texture coordinate replacement mode for each texture unit."

Replace the text of section 3.3.3 (page 70) with the following:

"If MULTISAMPLE is enabled, and the value of SAMPLE_BUFFERS is one, then points are rasterized using the following algorithm, regardless of whether point antialiasing (POINT_SMOOTH) is enabled or disabled. Point rasterization produces a fragment for each framebuffer pixel with one or more sample points that intersect a region centered at the point's (x_w, y_w). This region is a circle having diameter equal to the current point width if POINT_SPRITE_OES is disabled, or a square with side equal to the current point width if POINT_SPRITE_OES is enabled. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All data associated with each sample for the fragment are the data associated with the point being rasterized, with the exception of texture coordinates when POINT_SPRITE_OES is enabled; these texture coordinates are computed as described in section 3.3.

Point size range and number of gradations are equivalent to those supported for antialiased points when POINT_SPRITE_OES is disabled. The set of point sizes supported is equivalent to those for point sprites without multisample when POINT_SPRITE_OES is enabled."

Version

Number

Dependencies

    OpenGL ES 1.0 is required.
    ARB_point_parameters is required
    ARB_point_sprite is required

    The extension is written against the OpenGL 1.5 Specification.

Overview

    This extension extends how points and point sprites are rendered
    by allowing an array of point sizes instead of a fixed input point
    size given by PointSize.  This provides flexibility for applications
    to do particle effects.

    The vertex arrays will be extended to include a point size array.
    The point size array can be enabled/disabled via POINT_SIZE_ARRAY_OES.

    The point size array, if enabled, controls the sizes used to render
    points and point sprites.  If point size array is enabled, the point
    size defined by PointSize is ignored.  The point sizes supplied in the
    point size arrays will be the sizes used to render both points and
    point sprites.

    Distance-based attenuation works in conjunction with
    POINT_SIZE_ARRAY_OES.  If distance-based attenuation is enabled
    the point size from the point size array will be attenuated as
    defined by ARB_point_parameters to compute the final point size.

Version

    Last Modified Date: July 16, 2004

Number

Dependencies

    OpenGL 1.5 is required

Overview

    Many applications require the ability to be able to read the
    GL matrices.  OpenGL ES 1.1 will allow an application to read
    the matrices using the GetFloatv command for the common profile
    and the GetFixedv command for the common-lite profile.

    In cases where the common-lite implementation stores matrices
    and performs matrix operations internally using floating pt
    (example would be OpenGL ES implementations that support JSR184 etc.)
    the GL cannot return the floating pt matrix elements since the float
    data type is not supported by the common-lite profile.
    Using GetFixedv to get the matrix data will result in a loss of
    information.

    To take care of this issue, new tokens are proposed by this
    extension.  These tokens will allow the GL to return a
    representation of the floating pt matrix elements as as an array
    of integers, according to the IEEE 754 floating pt "single format"
    bit layout.

    Bit 31 represents the sign of the floating pt number.
    Bits 30 - 23 represent the exponent of the floating pt number.
    Bits 22 - 0 represent the mantissa of the floating pt number.

IP Status

    There is no intellectual property associated with this extension.

Issues

    None known.

New Procedures and Functions

New Tokens

    Accepted by the <pname> parameter of GetIntegerv:

MODELVIEW_MATRIX_FLOAT_AS_INT_BITS_OES 0x898d
PROJECTION_MATRIX_FLOAT_AS_INT_BITS_OES 0x898e
TEXTURE_MATRIX_FLOAT_AS_INT_BITS_OES 0x898f

Version

    Last Modified Date: 21 July 2004
    Author Revision 0.96

Number

    ???

Dependencies

    OES_fixed_point is required.
    EXT_fog_coord affects the definition of this extension.
    This extension is written against the OpenGL 1.3 and
    OpenGL ES 1.0 Specifications.

Overview

    This extension defines a mechanism for writing pixel
    rectangles from one or more textures to a rectangular
    region of the screen.  This capability is useful for
    fast rendering of background paintings, bitmapped font
    glyphs, and 2D framing elements in games.  This
    extension is primarily intended for use with OpenGL ES.

    The extension relies on a new piece of texture state
    called the texture crop rectangle, which defines a
    rectangular subregion of a texture object.  These
    subregions are used as sources of pixels for the texture
    drawing function.

    Applications use this extension by configuring the
    texture crop rectangle for one or more textures via
    ActiveTexture() and TexParameteriv() with pname equal to
    TEXTURE_CROP_RECT_OES.  They then request a drawing
    operation using DrawTex{sifx}[v]OES().  The effect of
    the latter function is to generate a screen-aligned
    target rectangle, with texture coordinates chosen to map
    the texture crop rectangle(s) linearly to fragments in
    the target rectangle.  The fragments are then processed
    in accordance with the fragment pipeline state.

IP Status

    No known IP issues.

Issues

    (1) Should we pass a texture name to the draw function,
        or use the currently bound texture?

        RESOLVED. Use the textures bound to currently
        enabled texture units.  This makes it easy for
        drivers to implement DrawTex*() using existing
        texture hardware.  If we didn't do this, they would
        have to save and restore the state of the texture
        unit(s).

    (2) Doesn't DrawPixels make this extension unnecessary?

        RESOLVED.  No.  DrawPixels is hard to support
        efficiently in hardware because the source pixels
        are in application memory.  Also, the pixel setup
        pipeline (PixelTransfer, PixelMap etc.) is redundant
        for the intended applications.  Also, PixelZoom
        looks ugly when the zoom factors are large, and there
        is no way to control filtering.  Using textures and
        texture units solves all of these problems.

    (3) Doesn't ARB_point_sprite make this extension unnecessary?

        RESOLVED. No.  Key differences include:
        * ARB_point_sprite uses the entire source texture to
          paint a point, i.e. its texture coordinates range
          from 0.0 to 1.0.  This extension allows a
          subregion of a texture to be used as the source.
        * ARB_point_sprite sprites are limited by the
          maximum point size, which may be small.  This
          extension is limited only by the maximum supported
          texture size and the screen size.
        * ARB_point_sprite sprites are square.  This
          extension supports general rectangles as sprite
          shapes.
        * ARB_point_sprite sprites are clipped as points, so
          if the center of a sprite falls outside the
```

frustrum, nothing is drawn. This extension draws any portion of a sprite that lies within the viewing frustrum. (There is a well-known work-around for this, but it’s ugly.)

(4) How is the texture sampled?

RESOLVED. It is sampled like a normal texture, and not like an image sent to DrawPixels. This facilitates implementing with texture hardware.

(5) How does this work when multisampling is enabled?

RESOLVED. Implementations should generate multisample texture coordinates using the same method they use in normal texture mapping. Approximations are acceptable, e.g. they may use the same texture value for all samples associated with a fragment generated by DrawTex*(), even if they use another policy for multisampled triangle rendering.

(6) Do we really want the full fragment pipeline to be active?

RESOLVED. Yes, on grounds of orthogonality and simplicity. Again, this makes it easy for existing hardware to implement the extension.

(7) How does this interact with user clip planes?

RESOLVED. User clip planes are ignored. This is a screen-level operation, so geometric entities like clip planes are irrelevant.

(8) How does this interact with mip-mapping?

RESOLVED. It behaves exactly as in texturing. This is really easy to do as LOD is a constant across the target rectangle.

(9) What happens when multiple texture units are enabled?

RESOLVED. All enabled texture units participate in generating the final fragment color. Each unit generates its own s,t based on its texture’s crop rectangle.

(10) Should the target location be specified by the current raster position (RasterPos or WindowPos), or by arguments to DrawTex*OES()?

```
     RESOLVED.  Use arguments passed to DrawTex*. In the
     intended uses, the target will be set once per call,
     so using arguments saves one inner loop function
     call.

(11) Do we want stretch-blt capability?

     RESOLVED. Yes.  Supply a window size as well as
     window position to DrawTex*()

(12) OpenGL ES issue: WindowPos (if we use it) adds 16
     entry points ({23}{sifd}[v]), which seems like a lot
     even if they are trivial.  Can we live with a
     subset?  (Note that the 'd' versions go away, but
     they are replaced by 'x' versions.)

     RESOLVED. Moot, as we do not use WindowPos.  But the
     intent was to add only 3{si}[v] versions (four entry
     points).  This is not orthogonal and may be
     surprising.  But there is no intent to support
     sub-pixel placement of rectangles, so the {fx}
     versions are superfluous.  {2} versions are easy to
     express using {3} versions.  Vector and individual
     argument versions are kept to reduce the surprise
     factor, and because constructing calls to a v-type
     function is a huge pain if you don't already have
     the data in vector format.

(13) TexCropRect*OES adds eight entry points.  Can we live
     with a subset?  For the intended use, integer values
     suffice, so the {fx} versions are superfluous.  But
     orthogonality and 'least-astonishment' are virtues
     too.

     RESOLVED. Moot. Replace with TexParameteriv().

(14) Would it be better to remove the texture crop
     rectangle from the state, and instead pass
     parameters to DrawTextureOES()?

     RESOLVED. No.  Drawing the same pixel pattern multiple
     times is a plausible usage scenario.

(15) Should texture crop rect parameters be stored internally
     as integers, or as float/fixed?  I.e. should we allow
     the crop rect to include fractional texels?  This is
     more flexible, but is not the intended use.  Software
     implementations would have to add a test for the (normal)
     special case of integer bounds.

     RESOLVED.  Integer only.  Texture crop rect is
     conceptually a subregion of an integer grid, so its
```

```
        natural coordinates are integers.

   (16) Should we have a single global crop rect, or one per
        texture unit?

        RESOLVED.  Neither.  We should have one per texture,
        with TexParameter setting the rect for the currently
        active texture.  It isn't a lot of state, it
        attaches the rect to a specific texture (which makes
        sense) rather than a texture unit (which doesn't),
        it is more orthogonal, and it allows tex coords to
        be meaningful (if not actually useful) when multiple
        texture units are enabled.

   (17) Should the destination rectangle specified by
        DrawTex*() be defined as integer only like the crop
        rectangle, or should its parameters be real-valued?

        RESOLVED.  Real-valued.  Since we now support
        stretch-blit, we want the ability to animate the
        scaling factor smoothly.  If the destination rectangle
        size is rounded to an integer, you won't get smooth
        animation.

New Procedures and Functions

  Added to OpenGL 1.3 and OpenGL ES 1.0:

    void DrawTex{sifx}OES(T X, T Y, T Z, T W, T H);
    void DrawTex{sifx}vOES(T* coords);

  Added to OpenGL ES 1.0:

    void TexParameter{ifx}v(enum target, enum pname, T param);

New Types

  None

New Tokens

  Accepted by the <pname> parameter of TexParameter()
  and GetTexParameter():

    TEXTURE_CROP_RECT_OES        0x8B9D

Additions to Chapter 2 of the OpenGL 1.3 Specification
(OpenGL Operation):
  None

Additions to Chapter 3 of the OpenGL 1.3 Specification
(Rasterization):

  In Table 3.19: Texture parameters and their values, p. 133,
  add this line at the end of the table:

  Name                     Type            Legal Values
  --------------------------------------------------------
  TEXTURE_CROP_RECT_OES    4 integers      any value

  In section 3.8.4, Texture Parameters, after paragraph 3
  (page 132) insert new paragraph:

  The texture parameter TEXTURE_CROP_RECT_OES controls the
  operation of DrawTex{sifx}[v]OES(), as described in
  section 5.7.  It has no effect on the rasterization of
  other primitives.

Additions to Chapter 4 of the OpenGL 1.3 Specification
(Per-Fragment Operations and the Frame Buffer):

  None

Additions to Chapter 5 of the OpenGL 1.3 Specification
(Special Functions):

  In Chapter 5, paragraph one, replace the last two words
  ("and hints.") with the words "hints, and texture
  rectangle drawing."

  After section 5.6, p. 196, insert:

  5.7 Texture Rectangle Drawing

    OpenGL supports drawing sub-regions of a texture to
    rectangular regions of the screen using the texturing
    pipeline.  Source region size and content are determined
    by the texture crop rectangle(s) of the enabled
    texture(s) (see section 3.8.14).

    The functions

    void DrawTex{sifx}OES(T Xs, T Ys, T Zs, T Ws, T Hs);
    void DrawTex{sifx}vOES(T *coords);

    draw a texture rectangle to the screen.  Xs, Ys, and Zs
```

```
specify the position of the affected screen rectangle.
Xs and Ys are given directly in window (viewport)
coordinates.  Zs is mapped to window depth Zw as follows:

             { n,                 if z <= 0
        Zw = { f,                 if z >= 1
             { n + z * (f - n),   otherwise

where <n> and <f> are the near and far values of
DEPTH_RANGE.  Ws and Hs specify the width and height of
the affected screen rectangle in pixels.  These values
may be positive or negative; however, if either (Ws <=
0) or (Hs <= 0), the INVALID_VALUE error is generated.

Calling one of the DrawTex functions generates a
fragment for each pixel that overlaps the screen
rectangle bounded by (Xs, Ys) and (Xs + Ws), (Ys + Hs).
For each generated fragment, the depth is given by Zw
as defined above, and the color by the current color.

If EXT_fog_coord is supported, and FOG_COORDINATE_SOURCE_EXT
is set to FOG_COORINATE_EXT, then the fragment distance for
fog purposes is set to CURRENT_FOG_COORDINATE. Otherwise,
the fragment distance for fog purposes is set to 0.

Texture coordinates for each texture unit are computed
as follows:

Let X and Y be the screen x and y coordinates of each
sample point associated with the fragment.  Let Wt and
Ht be the width and height in texels of the texture
currently bound to the texture unit.  (If the texture is
a mipmap, let Wt and Ht be the dimensions of the level
specified by TEXTURE_BASE_LEVEL.)  Let Ucr, Vcr, Wcr and
Hcr be (respectively) the four integers that make up the
texture crop rectangle parameter for the currently bound
texture.  The fragment texture coordinates (s, t, r, q)
are given by

s = (Ucr + (X - Xs)*(Wcr/Ws)) / Wt
t = (Vcr + (Y - Ys)*(Hcr/Hs)) / Ht
r = 0
q = 1

In the specific case where X, Y, Xs and Ys are all
integers, Wcr/Ws and Hcr/Hs are both equal to one, the
base level is used for the texture read, and fragments
are sampled at pixel centers, implementations are
required to ensure that the resulting u, v texture
indices are also integers.  This results in a one-to-one
mapping of texels to fragments.
```

```
    Note that Wcr and/or Hcr can be negative.  The formulas
    given above for s and t still apply in this case.  The
    result is that if Wcr is negative, the source rectangle
    for DrawTex operations lies to the left of the reference
    point (Ucr, Vcr) rather than to the right of it, and
    appears right-to-left reversed on the screen after a
    call to DrawTex.  Similarly, if Hcr is negative, the
    source rectangle lies below the reference point (Ucr,
    Vcr) rather than above it, and appears upside-down on
    the screen.

    Note also that s, t, r, and q are computed for each
    fragment as part of DrawTex rendering.  This implies
    that the texture matrix is ignored and has no effect on
    the rendered result.

Additions to Chapter 6 of the OpenGL 1.3 Specification
(State and State Requests):

  None

Additions to Appendix A of the OpenGL 1.3 Specification
(Invariance):

  None

Additions to the AGL/GLX/WGL Specifications:

  None

Additions to Chapter 2 of the OpenGL ES 1.0 Specification
(OpenGL Operation):

  None

Additions to Chapter 3 of the OpenGL ES 1.0 Specification
(Rasterization):

  After the fourth paragraph of section 3.8, Texturing,
  p. 17, insert a new paragraph:

  DrawTexOES is supported.

  In the (unnamed) table of supported texture functions,
  p. 19, delete the entry for TexParameter{i[v] fv}(), and
  replace the entry for TexParameterf() with the following:
```

OpenGL 1.3	Common	Common-Lite
TexParameter{if}[v](enum target, enum param, T param)		
target = TEXTURE_2D, pname = TEXTURE_CROP_RECT_OES	(check)	(check)
target = TEXTURE_1D, TEXTURE_3D, TEXTURE_CUBE_MAP	-	-
pname = TEXTURE_MIN_FILTER, TEXTURE_MAG_FILTER	(check)	(check)
pname = TEXTURE_WRAP_S, TEXTURE_WRAP_T	(check)	(check)
pname = TEXTURE_BORDER_COLOR	-	-
pname = TEXTURE_MIN_LOD, TEXTURE_MAX_LOD	-	-
pname = TEXTURE_BASE_LEVEL, TEXTURE_MAX_LEVEL	-	-
pname = TEXTURE_WRAP_R	-	-
pname = TEXTURE_PRIORITY	-	-

In the same table, modify the entry for
GetTexParameter{if}v() to read as follows:

OpenGL 1.3	Common	Common-Lite
GetTexParameter{if}v(enum target, enum param, T *params)	(check)	(dagger)

Additions to Chapter 4 of the OpenGL ES 1.0 Specification
(Per-Fragment Operations and the Frame Buffer):

None

Additions to Chapter 5 of the OpenGL ES 1.0 Specification
(Special Functions):

None

Additions to Chapter 6 of the OpenGL ES 1.0 Specification
(State and State Requests):

At the end of table 6.15, Texture Objects (cont.), p. 36,
insert a new entry:

State	Exposed	Queriable
TEXTURE_CROP_RECT_OES	(check)	(check)

Replace the fourth paragraph of Chapter 7, Core Additions and
Extensions, p. 46, with the following:

The Common and Common-Lite profiles add subsets of the
OES_byte_coordinates, OES_fixed_point, and
OES_single_precision ES-specific extensions as core
additions; OES_readFormat and
OES_compressed_paletted_texture as required profile

extensions; and OES_query_matrix and OES_draw_texture as optional profile extensions.

Additions to Chapter 7 of the OpenGL ES 1.0 Specification (Core Additions and Extensions):

At the end of Table 7.1: OES Extension Disposition, add a new entry:

Extension Name	Common	Common-Lite
OES_draw_texture	optional extension	optional extension

After section 7.6, Query Matrix, insert

7.7 Draw Texture

The optional OES_draw_texture extension allows rectangular subregions of a texture to be written to the screen using the fragment pipeline. Texture coordinates are generated for each fragment in the destination rectangle, such that texels in the source texture are mapped linearly to pixels on the screen.

GLX Protocol

None

Errors

None

Dependencies on OES_fixed_point

The DrawTex{sifx}[v]() function makes use of the ’x’ suffix and (in that form) accepts parameters of type fixed, as defined in OES_fixed_point.

Dependencies on EXT_fog_coord

EXT_fog_coord affects the distance that is used in the fog equations for fragments generated by DrawTex{sifx}[v](). If EXT_fog_coord is not supported, the fog distance for each fragment is set to zero. If EXT_fog_coord is supported, the fog distance depends on the value of

```
  FOG_COORDINATE_SOURCE_EXT.  If the latter is set to
  FRAGMENT_DEPTH_EXT, the fog distance is again set to zero.
  If FOG_COORDINATE_SOURCE_EXT is set to FOG_COORDINATE_EXT,
  the distance is set to CURRENT_FOG_COORDINATE.

New State

  (table 6.16, Texture Objects (cont.), p. 224):

                                            Initial
  Get Value         Type   Get Command      Value       Description   Sec   Attribute
  ---------         ----   -----------      ---------   -----------   ---   ---------
  TEXTURE_CROP_RECT  4xZ   GetTexParameteriv 0,0,0,0     texture crop  5.7   texture
                                                        rectangle

New Implementation Dependent State

    None.

Revision History

    July 21, 2004 (v0.96)

        - Modified to say that if Ws or Hs < 0 then an
          INVALID_VALUE error is generated

    July  16, 2004 (v0.95)

        - Corrected a bug in the text description of DrawTex
          with negative crop rectangle width or height.  Thanks
          to Petri Kero for the catch.

    July  14, 2004 (v0.9)

        - added a Zs parameter to the destination rectangle
          location specification.  This allows applications
          to control the depth coordinate of fragments generated
          by DrawTex().

        - Removed DOS-mode carriage returns.

    June  29, 2004 (v0.8)

        - Corrected dependencies to comply with ARB recommended
          practice for extensions.

        - Restructured the "Additions to the OpenGL ES 1.0 Spec"
          sections to separate changes by chapter, following
          ARB recommended practice for OpenGL and
          GLX specifications.
        - Modified TexParameter usage to be consistent with
          OpenGL ES 1.1.

        - Added a dependency on EXT_fog_coord.

        - Inserted enumerant value.

    June  16, 2004 (v0.7)

        - Modified to make texture crop rectangle part of
          texture state (set by TexParameter) rather than by
          an ad hoc function (TexCropRectOES).

        - Modified to provide stretch-blit functionality.

    May   28, 2004 (v0.6)

        - Formalized changes to 1.3 and ES 1.0 specs.
          Modified to take screen coordinate arguments
          rather than using the current raster position.

    May   19, 2004 (v0.5)

        - Simplified to support only one-to-one source
          blit.  Sprite functionality was moved to a
          separate proposal.

    May    4, 2004 (v0.4)

        - Rewrote to use explicit source and destination
          rectangles instead of overloading PixelZoom.
          Made current raster rectangle explicit and
          provided both screen space and object space
          ways to define it.

    April 13, 2004
- Initial version (v0.3)
```
